**Norges offisielle statistikk**

I denne serien publiseres hovedsakelig primærstatistikk, statistikk fra statistiske regnskapssystemer og resultater fra spesielle tellinger og undersøkelser. Serien har først og fremst referanse- og dokumentasjonsformål. Presentasjonen skjer vesentlig i form av tabeller, figurer og nødvendig informasjon om datamaterialet, innsamlings- og bearbeidingsmetoder, samt begreper og definisjoner. I tillegg gis det en kort oversikt over hovedresultatene.

Serien omfatter også publikasjonene Statistisk månedshefte, Statistisk årbok, Historisk statistikk og Regionalstatistikk, samt Standarder for norsk statistikk og Veiviser i norsk statistikk.

**Official Statistics of Norway**

This series consists mainly of primary statistics, statistics from statistical accounting systems and results of special censuses and surveys, for reference and documentation purposes. Presentation is basically in the form of tables, figures and necessary information about data, collection and processing methods, and concepts and definitions. In addition, a short overview of the main results is given.

The series also includes the publications Monthly Bulletin of Statistics, Statistical Yearbook, Historical Statistics and Regional Statistics, as well as Standards for Norwegian Statistics and Guide to Norwegian Statistics.

# Preface

This publication provides national accounts statistics for the years 1978-1996. The 1995 and 1996 figures are preliminary. For the years 1978-1994 the publication contains final and more detailed figures. Input-output tables are presented for two years: 1978 and 1994. The publication contains output, intermediate consumption, value added, income components and employment by industries, and consumption, gross capital formation, fixed assets, exports and imports. National accounts statistics covering institutional sectors are published in National Accounts 1978-1996: Institutional Sector Accounts.

The figures presented here are estimates from the main revision of the Norwegian national accounts, compiled according to the guidelines of the System of National Accounts 1993 and the European System of Accounts 1995. The main revision has improved the quality of national accounts by using new methods of estimation and new statistical sources. New definitions have also been introduced. Definitions and classifications of the revised national accounts are reviewed in the text.

Some principal figures back to 1978 have been published in the Weekly Bulletin of Statistics no. 18/97 and in Economic Analyses no. 4/97. Besides, principal figures from the national accounts can be found on Internet at Statistics Norway's Web-pages.

This publication is also available with text in Norwegian: Nasjonalregnskapsstatistikk 1978-1996: Produksjon, anvendelse og sysselsetting.

The publication is prepared by Division for National Accounts. Head of Division is Liv Hobbelstad Simpson.

62. Value added by kind of activity at basic prices. Annual percentage change in volume.....	154
63. Value added by kind of activity at basic prices. Annual percentage change in prices .....	158
64. Consumption of fixed capital by kind of activity. Current prices. Million kroner .....	162
65. Consumption of fixed capital by kind of activity. Annual percentage change in volume.....	166
66. Compensation of employees by kind of activity. Million kroner.....	170
67. Operating surplus by kind of activity. Million kroner .....	174

**Employment, by detailed kind of activity 1978-1994**

68. Employed persons by kind of activity. Employees and self-employed. 1000 .....	178
69. Employed persons by kind of activity. Employees. 1000 .....	182
70. Employed persons by kind of activity. Employees and self-employed. Females. 1000 .....	186
71. Full-time equivalent persons by kind of activity. Employees and self-employed. 1000 .....	190
72. Full-time equivalent persons by kind of activity. Employees. 1000 .....	194
73. Full-time equivalent persons by kind of activity. Employees and self-employed. Females. 1000 .....	198
74. Total hours worked by kind of activity. Employees and self-employed. Millions.....	202
75. Total hours worked by kind of activity. Employees. Millions .....	206
76. Total hours worked by kind of activity. Employees and self-employed. Females. Millions .....	210

**Consumption 1978-1994**

77. Household final consumption expenditure. Current prices. Million kroner .....	214
78. Household final consumption expenditure. Constant 1990-prices. Million kroner .....	216
79. Household final consumption expenditure. Annual percentage change in volume .....	218
80. Household final consumption expenditure. Annual percentage change in prices.....	220
81. Final consumption expenditure of non-profit institutions serving households. Current prices. Million kroner...	222
82. Final consumption expenditure of non-profit institutions serving households. Constant 1990-prices. Million kroner.....	222
83. Final consumption expenditure of non-profit institutions serving households. Annual percentage change in volume .....	222
84. Final consumption expenditure of non-profit institutions serving households. Annual percentage change in prices .....	222
85. Government final consumption expenditure by function. Current prices. Million kroner .....	224
86. Government final consumption expenditure by function. Constant 1990-prices. Million kroner .....	224
87. Government final consumption expenditure by function. Annual percentage change in volume .....	224
88. Government final consumption expenditure by function. Annual percentage change in prices .....	226
89. Central government final consumption expenditure by function. Current prices. Million kroner.....	226
90. Central government final consumption expenditure by function. Constant 1990-prices. Million kroner .....	226
91. Central government final consumption expenditure by function. Annual percentage change in volume .....	228
92. Central government final consumption expenditure by function. Annual percentage change in prices.....	228
93. Local government final consumption expenditure by function. Current prices. Million kroner .....	228
94. Local government final consumption expenditure by function. Constant 1990-prices. Million kroner.....	228
95. Local government final consumption expenditure by function. Annual percentage change in volume .....	230
96. Local government final consumption expenditure by function. Annual percentage change in prices .....	230

**Capital formation and fixed assets 1978-1994**

97. Gross fixed capital formation by type of capital goods. Current prices. Million kroner.....	230
98. Gross fixed capital formation by type of capital goods. Constant 1990-prices. Million kroner .....	230
99. Gross fixed capital formation by type of capital goods. Annual percentage change in volume .....	232
100. Gross fixed capital formation by type of capital goods. Annual percentage change in prices.....	232
101. Fixed assets by type of capital goods. Current prices. Million kroner .....	232
102. Fixed assets by type of capital goods. Annual percentage change in volume.....	234
103. Consumption of fixed capital by type of capital goods. Current prices. Million kroner.....	234
104. Consumption of fixed capital by type of capital goods. Annual percentage change in volume .....	234

**Input-output tables 1978 and 1994**

105. Input-output table 1978 at basic prices. Endogenous imports. Million kroner .....	236
106. Input-output table 1994 at basic prices Endogenous imports. Million kroner .....	238
107. Inverse matrix 1978 at basic prices. Endogenous imports .....	240
108. Inverse matrix 1994 at basic prices. Endogenous imports .....	240

## 1. Introduction

The national accounts statistics are designed to provide a consistent and comprehensive survey of the national economy. The national accounts contain national aggregates, and give detailed descriptions of transactions between different sectors of the economy, including the rest of the world. The national accounts also provide information on different types of capital stocks. Statistics from many areas are utilized in the national accounts. Some parts of the national accounts are constructed more or less directly from other statistics, while other parts are based heavily on calculations and estimations.

Statistics Norway has recently completed a main revision of the national accounts. More than 20 years have elapsed since the last main revision, while the earlier revisions were normally undertaken every 10 years or so. Consequently, it was necessary this time to conduct a very comprehensive examination of the sources and methods of the national accounts. In addition, new definitions and classifications are introduced based on new international guidelines of the System of National Accounts 1993 (SNA 1993, published by UN, OECD, IMF, the World Bank and the Commission of the European Communities in 1993) and the European System of Accounts 1995 (ESA 1995, published by Eurostat/EC-Commission in 1996). Norway has, according to the EEA-treaty, an obligation to implement ESA 1995.

The first results from the main revision, figures for years 1988-1992, were released by summer 1995. Statistics Norway has later on published revised final estimates for 1993 and 1994, and provisional estimates for 1995 and 1996. In addition, quarterly estimates have been published according to the new system of national accounts. Also revised time series back to 1978 are published. Then, also in 1997, revised estimates of non-financial assets and consumption of fixed capital are added, making it possible to arrive at net concepts for income and saving.

Definitions and classifications of the national accounts are reviewed below. This review is related to the figures presented in this publication, i.e. production, uses and employment. Valuation principles and methods of calculations on volume and price changes are also briefly described below. Chapter 7 contains a description of the input-output tables, and the calculation of capital stock and consumption of fixed capital are described in chapter 8.

## 2. Definitions

### 2.1. GDP and production

#### **Gross domestic product (GDP)**

- = Output – Intermediate consumption + Taxes on products, net – Correction for FISIM
- = Total value added + Taxes on products, net – Correction for FISIM
- = Final consumption expenditure + Gross fixed capital formation + Changes in inventories + Exports – Imports
- = Final uses – Imports
- = Final domestic uses + Exports – Imports
- = Compensation of employees + Gross operating surplus + Taxes on production – Subsidies on production – Correction for FISIM
- = Compensation of employees + Operating surplus + Consumption of fixed capital + Taxes on production – Subsidies on production – Correction for FISIM

BNP is the Norwegian abbreviation for GDP (Gross Domestic Product). It refers to the sum of the gross values added of all units engaged in production, and consequently all income generated from production. GDP may be defined and compiled from three different main approaches (cf. the three definition blocks above), i.e. the production or output approach, the expenditure approach and the income approach. In the first block, the item "Correction for FISIM" might have been alternatively included with intermediate consumption and in the third block with gross operating surplus.

#### **Output**

Value of the goods and services that are produced from resident production. This cover market production, production for own final use, and non-market production in general government and in non-profit institutions serving households.

The term has been amended from gross output as gross/net is not distinguished for this item.

Production of goods and services (products) should not be mistaken for sale or turnover of products. Correction items such as taxes on products and subsidies on products are not included with output, but are considered as additional items to total value added of the industries in order to arrive at GDP (at market prices).

#### **Intermediate consumption**

Value of the goods and services consumed (transformed or used up) as inputs by the production process, excluding fixed assets whose consumption is recorded as consumption of fixed capital.

More precise definitions are available, in particular for drawing up the borderlines against gross fixed capital formation and against compensation of employees. Intermediate consumption relates to products consumed and not to products that are purchased.

### **Taxes on products**

Compulsory, unrequited payments from units of production to general government as taxes payable per unit of goods and services when they are produced, delivered, sold, transferred or otherwise disposed of by their producers.

The contents of taxes on products are not much amended as a result of the revision.

### **Subsidies on products**

Current unrequited payments that government units make to units of production as subsidies payable per unit of goods and services which they produce, sell or import.

### **Taxes on products, net**

= Taxes on products – Subsidies on products

### **FISIM**

Value of financial intermediation services indirectly measured, i.e. for services which are not charged directly, defined as total property income receivable by financial intermediaries minus their total interest payable, excluding the value of property income receivable from the investment of own funds.

This part of output of financial intermediation (by banks and other financial institutions) is not allocated to various uses, but is unallocated and recorded as intermediate consumption (correction item to GDP), a convention which might be changed if international agreement is reached.

### **Value added**

The additional value created or income generated by the process of production, recorded for an industry or the total of all resident industries, and defined as the value of output less the value of intermediate consumption.

### **Market production and production for own final use**

Production carried out by producers whose output is all or mostly all marketed, respectively retained for their own final use.

The definitions of market and non-market production are based on certain criteria. Production for own final use by industry includes agriculture and hunting, fishing, general construction of buildings, building installation and completion, dwelling services (owner-occupiers etc.), and private households with employed

persons. In addition, products involved in market production might also be designated as products for own final use (e.g. agricultural products, firewood, fish etc.).

### **Total supply**

= Output + Taxes on products, net + Imports  
= Output at basic prices + Taxes on products  
– Subsidies on products + Imports

Taxes on products (and subsidies on products) include taxes (and subsidies) on products that are related to both domestic production and imports (including customs duties). Imports of individual goods are valued at cif. In the institutional sector accounts, output is recorded at producers' prices (i.e. including taxes on products, net).

## **2.2. Final use categories**

### **Final uses**

= Final consumption expenditure + Gross fixed capital formation + Changes in inventories + Exports

### **Final consumption expenditure**

= Household final consumption expenditure + Final consumption expenditure of NPISHs  
+ Central government final consumption expenditure + Local government final consumption expenditure  
= Actual final consumption of households + Actual final consumption of general government

The first relationship defines total final consumption expenditure of the sectors. The second relationship sums up total consumption of goods and services acquired by the sectors, i.e. by the value of all the individual consumption of goods and services acquired by resident households irrespective of which sector is financing them, and by the value of the collective consumption services provided by general government to the community or large sections of the community.

### **Government final consumption expenditure**

= Central government final consumption expenditure + Local government final consumption expenditure  
= Individual consumption of general government + Collective (actual final) consumption of general government

### **Collective consumption of general government**

Government final consumption expenditure (such as general public services, defence affairs, public order and safety affairs, industry-related economic affairs and services) that do not provide a mechanism for redistributing resources among individual households.

Collective consumption is the part of government consumption expenditure that is actually acquired by the general government, while the remaining government consumption expenditure (such as education, health, social security and welfare) are expenditures incurred by general government as well, but actually acquired by households.

### **Consumption of goods**

Household consumption expenditure that relates to households' consumption of goods.

Household consumption expenditure of goods should not be mixed up with actual consumption of goods acquired by households (not specified in tables). The difference is equal to individual consumption of goods in consumption expenditure of general government and NPISHs (minor importance since most individual consumption expenditure of these sectors relates to services).

### **Consumption of services**

Household consumption expenditure that relates to households' consumption of services.

Household consumption expenditure of services should not be mixed up with household actual consumption of services, which has a far wider content (see above).

### **Household final consumption expenditure**

Expenditure incurred by resident households on consumption goods and services.

Household durables and semi-durables - except expenditure on dwellings and valuables - are recorded as household consumption expenditure in the period they are acquired (purchased). Expenditure on dwellings by households constitutes gross fixed capital formation, while dwelling services (rentals) are recorded annually over the period of service lives of the dwellings as part of the household consumption expenditure.

### **Final consumption expenditure of NPISHs**

Expenditure incurred by non-profit institutions serving households on consumption goods and services. These expenditures add up from intermediate consumption (goods and services which NPISHs need for their production of education, health, cultural and other services), compensation of employees, consumption of fixed capital, any taxes on production, while deducting receipts from sales.

Final consumption expenditure of NPISHs is treated as actual final consumption of households, i.e. total value of final consumption expenditure of NPISHs is allocated as acquired by households.

### **Local government final consumption expenditure**

Expenditure incurred by local government on consumption goods and services. These expenditures add up - as before - from intermediate consumption (goods and services which local government needs for its production), compensation of employees in local government, consumption of fixed capital in local government, any corresponding taxes on production, net, while deducting receipts from sales from local government to other sectors. In addition, local government final consumption expenditure includes consumption goods and services that local government has purchased (i.e. expenditure incurred) from market producers and supplied directly to households.

Local government final consumption expenditure consists of two main parts, i.e. collective (actual) final consumption of local government and individual consumption expenditure of local government which is also part of actual final consumption of households.

### **Central government final consumption expenditure**

Expenditure incurred by central government on consumption goods and services. These expenditures add up - as before - from intermediate consumption (goods and services which central government needs for its production), compensation of employees in central government, consumption of fixed capital in central government, any corresponding taxes on production, net, while deducting receipts from sales from central government to other sectors. In addition, central government final consumption expenditure includes consumption goods and services that central government has purchased (i.e. expenditure incurred) from market producers and supplied directly to households.

Central government final consumption expenditure consists of two main parts, i.e. collective (actual) final consumption of central government and individual consumption expenditure of central government which is also part of actual final consumption of households.

### **Actual final consumption of households ( = Actual individual consumption)**

- = Household final consumption expenditure + Final consumption expenditure of NPISHs + Individual consumption expenditure of central government + Individual consumption expenditure of local government

Individual consumption expenditure is exclusively - related to households (i.e. only sector to acquire individualized consumption goods and services).

**Gross capital formation**

- = Gross fixed capital formation + Changes in inventories + Net acquisitions of valuables

Net acquisitions of valuables entail an extended content of gross capital formation, but so far with poor empirical coverage for this new item. Gross capital formation as a term diverges from the similar term gross real investment (see below) which is used to distinguish investment in non-financial assets from investment in financial assets (cf. net lending/net borrowing).

**Gross real investments**

Gross capital formation (including addition for the value of non-produced non-financial assets).

**Gross fixed capital formation**

Value of acquisitions less disposals of new or existing fixed assets. Fixed assets consist of both tangible fixed assets (dwellings, other buildings and structures, machinery and equipment, cultivated assets) and intangible fixed assets (mineral exploration, computer software and other intangible fixed assets).

Apart from extended coverage for intangible fixed assets and new valuation principle for large items (see below), the definition is more or less as before the revision. The borderline against intermediate consumption is drawn by value magnitude and not by duration as before.

**Changes in inventories**

Value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories. Goods (and services that may take a long time to produce, such as software development) are relevant for changes in inventories, also including work-in-progress, as well as work-in-progress on cultivated assets (single-use plants or livestock - also including young fish - for later slaughtering).

Net acquisitions are partly actual purchases and sales of goods, but also reflect internal transactions of the producers. In practice, changes in inventories of goods in general are determined as total supply less total other uses of each good and subsequently summed over all goods.

**Exports of goods and services**

Value of goods and services from residents to non-residents.

**Imports of goods and services**

Value of goods and services from non-residents to residents.

**Export surplus**

- = Exports – Imports

**Total uses**

- = Intermediate consumption + Final consumption expenditure + Gross fixed capital formation + Changes in inventories + Exports
- = Final uses + Intermediate consumption
- = Domestic uses + Exports
- = Final domestic uses + Exports + Intermediate consumption

**2.3. Income components****Compensation of employees**

- = Wages and salaries + Employers' social contributions

**Wages and salaries**

Remuneration to employees as entitled to receive from employers in respect of work done during the relevant period (before adding employers' social contributions).

Wages and salaries are both in cash and in kind. Wages and salaries in cash include pay for overtime, and sickness and maternity allowances paid by employers. Wages and salaries in kind consist of goods and services, or other benefits, provided free or at reduced prices by employers, that can be used by employees at their own discretion. Wages and salaries subsequently are distributed to households and to rest-of-the-world (i.e. for non-residents employed with resident producers, cf. foreigners on Norwegian ships and employees not fulfilling the one-year criterion to their centre of economic interest).

**Employers' social contributions**

Value of social contributions incurred by employers in order to obtain social benefits for their employees, paid to central government and to autonomous social security and pension funds as well as non-autonomous pension funds. They include the following sub-items: employers' contributions to National Insurance, employers' other actual social contributions (contributions to the Public Service Pension Fund, Municipal Pension Funds, other social security schemes, employers' contributions to employees with low wages and salaries, and other social contributions), and in addition, employers' imputed social contributions (which coincide with social benefits actually paid - i.e. through unfunded arrangements - from employers to present or former employees).

**Other taxes on production**

Taxes - except taxes on products - that resident producers incur, and that are payable to general government, as a result of engaging in production.

The contents of other taxes on production are not much amended as a result of definitional changes due to the revision.

### **Other subsidies on production**

Subsidies - except subsidies on products - that resident producers may receive from general government, as a consequence of engaging in production.

The contents of other subsidies on production are reduced considerably as a result of definitional changes due to the revision.

### **Taxes on production**

= Taxes on products + Other taxes on production

### **Subsidies on production**

= Subsidies on products + Other subsidies on production

### **Gross operating surplus**

= Gross domestic product - Compensation of employees – Taxes on production + Subsidies on production

Gross operating surplus may also be estimated directly by using the income approach (see GDP above).

Earlier, there was no distinction between operating surplus and mixed income in the household sector.

### **Gross operating surplus by activity**

= Value added - Compensation of employees - Other taxes on production + Other subsidies on production

### **Operating surplus**

= Gross operating surplus – Consumption of fixed capital

Operating surplus is a measure of the surplus accruing from processes of production before deducting any explicit or implicit interest charges, rents or other property incomes payable on the financial assets, land or other tangible non-produced assets required to carry on the production.

### **2.4. Fixed assets and consumption of fixed capital**

#### **Fixed assets**

Consist of both tangible fixed assets (dwellings, other buildings and structures, machinery and equipment, cultivated assets etc.) and intangible fixed assets (mineral exploration, computer software and other intangible fixed assets).

Inventories and valuables that are not used repeatedly in production, are not counted as fixed assets. Neither do natural assets that are not produced.

### **Consumption of fixed capital**

Decline in the current value of the stock of fixed assets as a result of physical deterioration, normal obsolescence or normal accidental damage.

### **2.5. Employment**

#### **Employed persons**

Average number of persons employed with resident producers. Persons employed part-time and persons temporary on leave are included.

Foreign employees engaged in domestic production, of which foreign seamen on Norwegian owned ships or ships rented from abroad are included. Numbers employed are distributed by activities, gender and employees vs. self-employed.

#### **Full-time equivalent persons**

Defined as number of persons full-time employed, plus number of persons part-time employed recalculated to full-time equivalent basis.

Numbers of full-time equivalent employees are arrived at by recalculating to full-time equivalent basis by using share of full posts or of wages as weights. Numbers of full-time equivalent self-employed are arrived at on the basis of working time of self-employed males.

#### **Total hours worked**

Hours worked in domestic production within effective and normal working hours with addition for overtime while deducting absences due to sickness, leave of absence, vacations and any labour conflicts.

Hours worked are also influenced by the calendar effect (movable holidays and leap years). For self-employed, hours worked are determined as actual working hours adjusted for absence.

## **3. Classifications of the national accounts**

### **3.1. Accounting system of the national accounts**

The accounting system of the national accounts contains a listing of the specifications of accounts used. The new accounting system for the revised Norwegian national accounts, is based on the international standards for national accounts SNA 1993 and ESA 1995. The accounting system gives the framework and contents for the production of national accounts statistics. In addition to accounting structure, the accounting system contains a number of groupings or classifications used in the national accounts. The most important of these are described below.

### **3.2. Institutional sector classification**

The institutional sector classification lists the main sectors of the economy, i.e. non-financial corporations, financial corporations, general government, households and rest-of-the world, with the corresponding sub-sectors. This classification is particularly important for the production and publication of national accounts statistics and balance of payments statistics, while also playing a central role for credit market statistics and financial balance sheets. For more information about the institutional sector classification, see National Accounts 1978-1996: Institutional Sector Accounts (NOS C 427).

### **3.3. Activity classification of the national accounts**

The activity classification used in the national accounts refers to aggregates that are based on the new Norwegian Standard Industrial Classification (SN94), which is an elaboration of the EU-standard NACE Rev.1. The detailed activity classification of the revised national accounts contains 148 industries (see appendix A), while the quarterly national accounts have much fewer industries specified. Several levels of aggregation have been introduced for publication and reporting purposes. The activity classifications used in this publication are presented in appendix B-D. Most industries (142) have market production, while production for own final use is limited to 6 industries. Non-market production is relevant for 14 industries in central government, 9 (or actually 7) industries in local government and 7 industries in non-profit institutions serving households. Thus, each of these categories of production (producers) may be broken down by their respective industries. Market producers have receipts from sale that normally exceed their costs of production, which is not the case for the NPISs serving households (partly also financed by general government).

### **3.4. Transactions in goods and services**

This is a listing of variables for which transactions of the national accounts are grouped in terms of products. The main categories are output, intermediate consumption, final consumption expenditure (and actual final consumption), gross capital formation, exports and imports. Output is distributed on market and non-market output, plus output for own final use. Non-market output has sub-categories for central government, local government and the NPISHs. The former two sub-categories define the production of general government, when also some market output in local government (water supply, sewage and refuse disposal) are added. Important consumption categories are individual consumption expenditure, collective consumption expenditure and actual final consumption - concepts which are defined above. Gross capital formation consists of former categories of gross fixed capital formation and changes in inventories, plus a new category of acquisitions less disposals of valuables.

A main breakdown of exports and imports follows the distinction between goods and services.

### **3.5. Distributive transactions**

This is a listing of variables for which transactions of national accounts is relevant for the various income accounts. The main categories are wages and salaries, employers' social contributions, taxes on production, subsidies, property income, current taxes on income, wealth etc., social benefits, other current transfers and capital transfers. Components of compensation of employees (see definitions above) and taxes on production and subsidies (with components for taxes on products and other taxes on production, respectively subsidies on products and other subsidies on production) are relevant for this publication, while the other categories of distributive transactions will be mostly exposed in the publication on institutional sector accounts.

### **3.6. Classification of balancing items in the national accounts**

This is a listing of main aggregates which are arrived at as balancing items in the national accounts and balance of payments, such as GDP, GNI, disposable income, saving, net lending/net borrowing, export surplus and external balance of current account. These are main aggregates that are among the most important concepts used in the production and presentation of national accounts and balance of payments statistics.

### **3.7. Classification of non-financial assets**

This is a classification by type for aggregates of non-financial assets, such as tangible and intangible fixed assets, inventories, valuables, and non-produced assets, both including tangible assets such as land, subsoil assets, water resources etc. and intangible assets such as patented entities, transferable contracts etc. It classifies the various types of non-financial assets according to the structure of these main items. This classification is more aggregated than the corresponding classification used for gross capital formation by type.

### **3.8. Product classification of the national accounts**

Product classification of the national accounts relates to aggregates of goods and services that are specified in the national accounts (see transactions in goods and services above which define those variables for which the product classification applies). The classification is based on EU's central product classification CPA - Statistical Classification of Products by Activity in the European Community (Eurostat, 21.10.1992). CPA is a grouping of products by activities, i.e. it defines characteristic products within each activity and which are thus connected to the activity classification NACE Rev.1. Excluding the products introduced for mere technical accounting reasons, the new product

classification of the national accounts contains 680 aggregated goods (of which 565 are manufacturing goods) and 300 aggregated services. In the quarterly national accounts the number of products are much less.

### **3.9. Classification of individual consumption by purpose**

This is the classification of consumption used in the national accounts for household final consumption expenditure and household actual final consumption. For publication, this classification and the more aggregated versions appear in the same hierarchical system, with groupings of 10, 35 and 112 items of consumption purposes. This new classification of individual consumption by purpose is based on the one presented in SNA 1993 and ESA 1995 (COICOP - Classification Of Individual Consumption by Purpose). COICOP are however slightly revised in 1997.

### **3.10. Classification of the functions of the government**

This is a classification by purpose which is applied to all types of expenses of general government, such as government final consumption expenditure, gross fixed capital formation, subsidies, property income (i.e. expenses), capital transfers and other transfers, for use in financial accounts of government and in the national accounts. This classification is based on the version of COFOG (Classification Of Functions Of the Government) which was presented in SNA 1993 and ESA 1995, but has appeared in a somewhat revised version in 1997. In the national accounts, 55 COFOG-groups are specified, of which 51 groups distribute central government final consumption expenditure and 25 groups distribute local government final consumption expenditure.

### **3.11. Classification of the purposes of the non-profit institutions serving households**

This is a minor purpose classification which applies to the expenses of the NPISHs. It is based on the international classification referred to in SNA 1993 as COPNI (Classification Of the Purposes of the Non-profit Institutions serving households). The revised national accounts specify 5 such groups of purposes.

### **3.12. Classification of outlays of producers by purpose**

This is a purpose classification not yet developed in the Norwegian statistical system. It will have an international basis in COPP (Classification of Outlays of Producers by Purposes) - also presented in SNA 1993 - and is an alternative classification of the outlays of producers by purpose, such as sales promotion, research and development, pollution abatement and control, employee training etc.

## **4. Valuation**

Valuation is particularly relevant for transactions in goods and services, but also to the general aspect of time of recording (cf. cash values or accruals values, and other principles in recording of statistical data). The transactions of variables to appear in this publication (the national accounts of the real economy) apply in general the accruals basis principle of recording. Thus, taxes on production and subsidies are basically recorded in accruals values and not as recorded in the government accounts (taxes on production and subsidies in cash values).

Transactions in goods and services have different price references for their recording. Output is valued at basic prices in the cases of market production and production for own final use (i.e. basic prices for similar products in market production), while non-market output (per convention) is recorded by total costs of production in lack of prices. The use categories - both intermediate consumption and final uses - are valued at purchasers' prices, including exports at fob. Imports are valued at cif. Basic prices mean that corresponding taxes on products are deducted and subsidies on products added to output recorded at producers' prices (excluding value added tax). Previously, the estimates of output were published at producers' prices (excluding VAT). However, the principle of output at basic prices has been introduced in SNA 1993 og ESA 1995 for the purpose of achieving a standard common valuation internationally and at national level.

Output at basic prices has implications such as:

- value added of an industry is "valued" at basic prices (calculated as output at basic prices less intermediate consumption at purchasers' prices)
- taxes on products (including value added tax and investment levy) and subsidies on products are not distributed by industry
- total value added of the industries also is "valued" at basic prices
- GDP is "valued" at market prices, which means that taxes on products less subsidies on products are added to total value added of the industries at basic prices
- accruals VAT (i.e. VAT on output less non-deductible VAT on intermediate consumption and other uses) is among the taxes on products to be added to arrive at GDP
- taxes and subsidies on production that are not recorded as taxes and subsidies on products (i.e. other taxes on production, other subsidies on production) are distributed by industry and thus influence the magnitudes of operating surplus of the industries (but not value added of the industries).

## 5. Calculations on volume and price changes

The calculation of national accounts data on changes of volume and prices mainly follows the same methods and approach as before the last main revision. Basically, constant-price estimates are calculated at prices of the previous year (in other words, changing base year every year). Subsequently, data on changes of volume are constructed in terms of growth rates and corresponding implicit data on changes of prices. In parallel, time series of indices are constructed by using 1990 = 100 as a reference year. The reference year 1990 is chosen in response to international recommendation advocating the use of years ending at 0 or 5 as base year or reference year.

Since Statistics Norway in 1990 switched to annual chaining and is changing base year on annual basis (also recommended in SNA 1993 and ESA 1995) - implying also that table components do not add to the totals of the same table except for previous year as base year - Statistics Norway normally has not published constant-price estimates expressed in the prices of a reference year. In this publication, this kind of constant-price estimates are published according to latest international recommendations, and which would be consistent with the data on changes in volume referred to in the series of growth rates and volume indices. The chaining is carried out separately for all items (with few exceptions).

The calculation of constant-price estimates is carried out within the framework of integrated supply and use tables at current prices, by deflating (current values that are divided by price indices) at the detailed product level. The deflation approach has in fact two dimensions, (i) differentiated by main categories of supply and use (deflating output, imports, exports and implicitly for domestic use), and (ii) differentiated through valuation (deflating current values at basic prices by price indices and implicitly determining the other value components, including adjustments against values at purchasers' prices). Constant-price estimates for aggregates of supply, uses and value added follow through adding up and balancing constant-price estimates of products. They include aggregates such as output by industry, categories of exports and imports, categories of final uses, intermediate consumption by industry, value added by industry and GDP.

This entails that the principle of double deflation is used, i.e. separate deflation of output and intermediate consumption in order to arrive at value added at constant prices as a balancing item, through a detailed input-output framework (supply and use tables). The condition of great details is linked to the condition that the individual products are as price homogeneous as

possible, with a possibility for adapting to available basic statistics for values as well as prices.

## 6. Revisions and publication of the national accounts

### 6.1. The current publication cycle

The national accounts for a specific time period are published in several versions. Quarterly national accounts are published about 2 months after the end of the quarter. For each new quarter presented, the figures for the previous quarters within the same year are revised. The quarterly accounts are more aggregated compared to later annual accounts and comprise transactions in goods and services by industries and final use, in addition to employment data.

In Norway, three provisional versions of the annual accounts are compiled before the final version is published. The first version is published about 1 month after the end of the year and are based on accumulated quarterly accounts. These results are revised 4 months later, and for the first time aggregated institutional sector accounts are included.

The next two versions are more disaggregated and are published about 16 and 28 months after the end of the accounting year respectively. The quarterly figures are harmonized with the final annual figures subsequently.

The national accounts are published in the Weekly Bulletin of Statistics, Economic Analyses and in Official Statistics of Norway publications. National accounts data are also reported to international organisations, e.g. OECD, EUROSTAT, IMF and United Nations.

### 6.2. Main revisions

Main revisions are the occasions when special attention is given to the actual levels of the national accounts items, whilst best possible year-to-year movements have a first priority in the current national accounting work. In addition, main revisions normally will introduce new methods of estimation, based on new basic statistics, as well as new definitions and classifications, based on revised international guidelines.

The results from the most recent main revision of the Norwegian national accounts were published in 1995. Norway was the first European country to adapt to the new international guidelines. The 1995 revision, no doubt, improved the quality of the Norwegian national accounts, in particular from a better utilization of the many important statistical sources behind the national accounts estimation. In addition, the revision included considerable enlargements, such as integrating new elements of the institutional sector accounts with real economy national accounts data.

The main revision also had direct impact on the compilation of balance of payments statistics, presented in Norway as an integral part of the national accounts. Balance of payments statistics follow the IMF guidelines (Balance of Payments Manual, fifth edition, 1993), which are now harmonized with SNA 1993.

The 1995 revision has quite considerably amended earlier estimates. One important reason for this is that more than 20 years have elapsed since last main revision of the national accounts was undertaken in Norway. Earlier, main revisions were normally undertaken every 10 years or so. In recent years, the direct use of main aggregates such as GDP and GNI has become more important, in particular as a reference item, and often as a financing assessment base in international economic policy. Need for best possible estimated levels, means that main revisions in future should be carried out more frequently than before.

## 7. Input-output

### 7.1. Input-output tables

Input-output tables give a detailed survey of the supply and use of goods and services of the whole economy. In Norway input-output tables are integrated in the national accounts, as recommended by SNA 1993. Comparable input-output data are now available for the years 1978-1994.

The input-output tables computed in the national accounts are rectangular SNA input-output tables, also called supply and use tables. The supply table is of the format industry  $\times$  product, and in addition showing imports by product. The use table is showing how products are used as intermediate consumption and as final use (capital formation, exports and consumption).

Figure 1. Supply and use tables

Supply		Use				
	Product l....n	Industry l....m	Final use			
Industry	1		Capital form.	Ex- ports	Con- sump- tion	Changes in invent.
Imports	m	Product 1 2 . . . n				

The input-output tables presented in this publication (tables 105 and 106) are of the traditional symmetric type like those we usually find in text books on the subject. They are deduced from the rectangular tables by applying assumptions about the structure of production and market behaviour. Symmetric input-output tables are simple in use and are more illustrative than the rectangular ones, in the way they describe how the industries depend upon each other. At the same time they are suitable for computing multiplier effects and import corrected figures (see below).

The conversion from the rectangular to the symmetric input-output table is done by starting with the balances of products (supply and use of each product). Domestic use of goods and services (intermediate consumption, consumption, capital formation, changes in inventories) and exports are linked directly to domestic suppliers (industries) and imports. It is assumed that all exports are supplied by domestic industries. The distribution of exports by supplying industries, is proportional with the output of the industries. Imports and the remaining part of domestic production is then subsequently distributed proportional to every domestic use category. This means that the same import share applies to all domestic use categories, and that all industries that supply a product, have the same market share in all types of use.

In the national accounts imports are distributed by product and not by industry. In the input-output tables, imports are distributed by industry by making the assumption that the products are produced and supplied from industries abroad, by the same classification that is used for domestic produced products.

Figure 2 shows the structure of a symmetric industry  $\times$  industry input-output table. The rows of a symmetric input-output table illustrate how the output of the industry is used partly as intermediate consumption in other industries and partly as final use (capital formation, exports, consumption). The rows then express market structures. The columns of a symmetric input-output table show input of raw materials, semi manufacture products and services that the establishments of an industry have received from establishments of other industries. The columns then express the production or cost structure of each industry.

Figure 2. Symmetric input-output table

	Use				Sum	
	Recipient	Final use				
Supplier	Industry l....m	Capital form.	Ex- ports	Con- sump- tion	Changes in invent.	
Industry:						
1						
2						
m						
Imports						
1						
2						
m						

## 7.2. Inverse matrices

An input-output table is an organized disposition of detailed information about the economy. An input-output model is a set of structural relations, equilibrium conditions and identities that is used for analytical purposes.

The input-output model is based on standard assumptions that deliveries from other industries to intermediate consumption of the industry we look at, are proportional to total output of the industry. Further we assume that these input-output coefficients are constant, independent of the changes of output we are analyzing. We also assume that the changes of final use are exogenous. A change in final use of an industry will then lead to an increase of the output of those industries that are supplying intermediate consumption to this industry. An output increase like this will further create demand increases of goods and services from other industries, and so forth. This is what we call a multiplier effect. Altogether the total increase of the demand for goods and services can be calculated from the inverse matrix.

The inverse matrix is calculated by solving the following input-output model:

$$x = H \bullet x + E \Rightarrow x = (I - H)^{-1} \bullet E.$$

Here  $x$  is a vector of output by industries,  $H$  is a matrix of input-output coefficients for intermediate consumption,  $I$  is the identity matrix (a matrix that has 1 along the diagonal and 0 elsewhere) and  $E$  is a matrix of final use deliveries. The inverse matrix then becomes  $(I - H)^{-1}$ .

One has to be attentive that the multiplier effects described here are limited by the assumption that all increases in final use are exogenous. In a more complete model for the whole economy, this increase in output of the industry would result in an increase in income, which would again result in an increase of consumption, capital formation etc. These increases would also give multiplier effects, thus the total effects may be larger than what is calculated here (tables 107 and 108).

## 8. The calculation of capital stock and consumption of fixed capital

In connection with the main revision of the Norwegian national accounts, new calculations have been made of capital stock and consumption of fixed capital. The calculations are primarily derived by the perpetual inventory method (PIM), which is based on long time series for gross fixed capital formation. Capital stock and capital consumption are estimated with the help of assumptions concerning asset lives and depreciation profiles. This method was also used previously to calculate capital stocks, but the depreciation method and asset lives have been changed. The time series of gross fixed capital formation have also been revised.

The depreciation profile has been changed from linear (straight-line) to geometric (declining balance) in most industries. This change came in response to empirical studies conducted in the US concerning prices of second-hand capital equipment. The estimates for service life have in many cases been revised downwards in order to be more in line with the estimates used in countries similar to Norway.

Figure 3 presents a schematic summary of the national accounts classification system for assets. The calculations that are described in this chapter cover stocks of fixed capital. In the national accounts, an asset is considered as a fixed asset if it satisfies the following two criteria:

1. It is the result of a production process.
2. It is used repeatedly in a production process for more than one year.

Fixed assets comprise tangible assets such as buildings, structures, transport equipment and machinery, and intangible assets such as computer software and expenditures on exploration for oil and gas. Inventories and valuables (e.g. precious metals and antiques), which cannot be used repeatedly in production, are not recorded as fixed assets. The same applies to naturally occurring assets such as land and petroleum resources, which are not produced.

Figure 3. Classification of assets in the national accounts

Capital stock can be measured in several ways. We can distinguish between capital as wealth and as a factor of production.

*Gross capital stock* is defined as the value of all assets which exist at a given time, valued at prices for new assets of the same type. It can be used as a measure of productive capacity.

*Net capital stock* is used to measure the value of wealth. This entails that the asset is valued at written-down replacement cost, i.e. gross capital stock less the cumulative consumption of fixed capital.

The calculations described here apply to net capital stock and changes in this value.

Net capital stock is included in the balance sheet accounts in the national accounts. In addition, the accounts show the change in the stock during a period, e.g. one year, based on the following definitional relationships:

- Net capital stock at 1 January
- + Gross fixed capital formation
- Consumption of fixed capital
- + Other changes in volume
- + Revaluations
- = Net capital stock at 31 December

*Consumption of fixed capital* is defined as the reduction in the value of net capital stock during the period of calculation due to normal physical deterioration, damage and obsolescence. Damage resulting from more exceptional events, such as war and natural disasters, are recorded as *other changes in volume*. Pure price changes, that are not due to age but rather

general inflation or altered conditions in a specific market, are recorded as *revaluations*.

National accounts figures for capital stock and capital consumption are mainly calculated by using the perpetual inventory method (PIM). This is a common method of calculation internationally, and was also used prior to the main revision.

PIM is based on long time series for gross fixed capital formation, and estimates capital stock and capital consumption with the help of assumptions concerning service lives and depreciation profiles.

The method is based on the definitional relationship between net capital stock at the beginning and end of a period, as described above. If constant prices are used, net capital stock in the period can be written as:

$$(1) \quad KN_t = KN_{t-1} + J_t - D_t$$

where  $KN_t$  is the net capital stock at the end of period  $t$ ,  $J_t$  is gross investment in the period and  $D_t$  is capital consumption. By inserting values for  $KN_{t-1}$  successively in equation (1), capital stock in period  $t$  can be calculated by adding up gross investment undertaken in earlier periods and deducting the sum of capital consumption.

$$(2) \quad KN_t = \sum_{s=0}^L (d_s * J_{t-s})$$

Here,  $d_s$  is the depreciation function, or depreciation profile, which shows the change in the value of assets as the age  $s$  increases to its maximum lifetime  $L$ .  $d_s$  has a value equal to 1 when the asset is new ( $d_0=1$ ) and declines gradually towards 0.

When the capital stock is calculated with the help of equation (2), capital consumption can be calculated by using equation (1):

$$(3) \quad D_t = J_t - (KN_t - KN_{t-1})$$

In order to calculate capital consumption and capital stock at current prices, constant-price figures are inflated using the price index for investment. Revaluations represent the change in capital stock at current prices that is not due to capital consumption or other changes in volume.

The calculations are carried out at a detailed level. The classification by industry is the same as that used in the calculations of production and fixed capital formation in the national accounts, covering about 175 industries. Within each industry, assets are divided by type (buildings, machinery, etc.). Altogether 17 different groups are used when calculating fixed assets.

As noted, the depreciation profile shows the reduction in the value of the asset as it ages. The depreciation covers both scrapping of assets and the reduction in the value of remaining assets. For some types of assets, which have an active second-hand market, it is possible to estimate the depreciation profile based on second-hand prices, but in other cases assumptions must be used.

In the earlier calculations of fixed assets, it was assumed that the depreciation profile was linear, i.e. that

$$(4) \quad d(s) = 1 - s/L$$

where  $s$  is the age and  $L$  is the maximum life.

Linear, or straight-line, depreciation is (at the moment) the most common internationally, and was the method recommended in the previous edition of the international guidelines for national accounts, SNA 1968. Empirical studies, based on prices of various types of second-hand assets suggest, however, that a geometric profile is a better approximation to actual depreciation than linear depreciation.

Geometric depreciation entails that the remaining value is reduced by an equal percentage (a) each year:

$$(5) \quad d(s) = (1 - a)^s$$

The new guidelines for national accounts, SNA 1993, permit both linear and geometric depreciation.

Against this background, Statistics Norway has in its new calculations of fixed assets started to use geometric depreciation profiles as the main principle. For general government and non-profit institutions, however, linear depreciation is still used. The reason for this is discussed further below.

The service life is not included directly in equation (5). The depreciation rate  $a$ , however, may be calculated on the basis of an estimate for lifetime  $L$ :

$$(6) \quad a = 2/L$$

Equation (6) is derived by setting the present value of depreciation from the linear and geometric method equal to each other. The depreciation rate  $a$  is a function of lifetime  $L$  and the discount rate. By letting the discount rate approach zero, we arrive at the simple relationship in equation (6).

With geometric depreciation the value of the asset in which the investment is made in one year falls more swiftly in the first few years compared with linear depreciation, and more slowly in later years. The total effect on capital consumption and capital stock of

shifting the depreciation profile depends on changes in investments. If investments rise over time, which is the case in most Norwegian industries, capital consumption will be higher and the stock lower with geometric than with linear depreciation.

In the sectors general government and non-profit institutions, the value of production is calculated as the sum of labour costs, intermediate inputs and capital consumption. Because results from the main revision were published before the new method of calculating fixed assets was finalised, capital consumption in these industries is based on the old method of calculation. The old figures for capital consumption are calculated using straight-line depreciation and somewhat longer service lives than those now being used for corresponding groups in other industries. Furthermore, capital consumption is being calculated for roads and other construction, which were previously assumed to be equal to zero. Previously, all acquisitions of capital equipment in the military establishment were recorded as intermediate inputs, entailing that there was no basis for calculating capital consumption and capital stock in this industry. This has been changed in connection with the main revision.

The service life of fixed assets is an important parameter in the depreciation functions. A report published by the OECD shows that estimates for service lives in Statistics Norway's earlier calculations of fixed assets were relatively high compared with those used in other countries. The report also shows that the estimates vary considerably between different countries. As a result of little empirical information concerning the service lives of fixed assets in Norway, we decided to revise our estimates based on those used in countries like Sweden, Germany and Canada. Service lives in the new calculations have therefore been revised downwards in many cases.

The table below shows the service lives used for the various groups in the calculations. In some cases the life varies between the different industries, with an interval specified.

**Service lives**

Asset type	Life (years)
Dwellings	80
Non-residential and commercial buildings	50-60
Constructions	10-90 Mainly 50-60
Production wells for oil and gas	20
Oil production platforms and drilling rigs	20
Oil and gas pipelines	40
Ships and boats	20 (Ships) 30 (Fishing boats)
Aircraft	20
Cars	10
Buses and trucks	10
Rolling stock	35
Machinery and equipment	10-40 Mainly 15
Computers and office equipment	8
Cultivated assets	Are not depreciated
Oil and gas exploration	20
Other intangible fixed assets	3
Valuables	Are not depreciated

The perpetual inventory method requires long time series for gross fixed capital formation. The series should start at least as many years prior to the first year of calculation as the service life of the asset in question.

As part of the main revision of the national accounts, new figures have been calculated for fixed capital formation, distributed in detail by industry and type at current and constant prices back to 1978. However, substantially longer time series than this are required to compute fixed capital from 1978 onwards. In connection with the method of calculation used earlier, long investment series distributed by industry and type were compiled. These have been reclassified for the new classification by industry and asset and adjusted to the new levels in 1978.

At the end of 1994 the total net stock of fixed capital was estimated at NOK 2621 billion. Measured at constant prices, capital stock increased by about 55 per cent from 1978 to 1994. By way of comparison, gross domestic product at constant prices rose by about 60 per cent in the same period. The annual growth in the stock of fixed capital was about 3.5 per cent up to the end of the 1980s and then declined to about 1 per cent in the years 1991 to 1993. The reduction in the growth rate for the stock of fixed capital is related to changes in gross fixed capital formation, which was reduced by about 20 per cent from 1988 to 1990.

Capital consumption in 1994 amounted to NOK 142 billion, corresponding to about 5.5 per cent of the net capital stock in the same year. The relatively low percentage reflects the fact that asset groups with long service lives account for the highest percentage of the stock.

Compared with the calculations carried out prior to the main revision, capital stock has been revised upwards

by 4 per cent in 1991, which is the last year for fixed capital figures based on the old method of calculation. Capital consumption has risen by 25 per cent. This is a result of the upward revision of gross fixed capital formation and changes in service lives and depreciation profiles. The revision of fixed capital formation varies considerably from one year to the next, partly as a result of the change in the principle for recording investment in oil production platforms, but the average for the years 1978 to 1991 is an upward revision of about 13 per cent. This should, ceteris paribus, result in an increase in capital consumption and stock of about the same level. However, as a result of a higher rate of depreciation and the introduction of capital consumption for some types of structures for which capital consumption was not applied earlier, capital consumption rises at a faster pace than fixed capital formation. From this it follows that the capital stock will increase at a slower pace.

## 9. Further information

In addition to the tables published in NOS National Accounts, it is possible to order more detailed tables by applying directly to Statistics Norway. Tables can be transmitted by paper (post or telefax), electronic by diskettes or by e-mail (Ascii or Excel).

National accounts figures can be found on Internet at Statistics Norway's Web-pages. The Web-address is: [http://www.ssb.no/www-open/statistikk\\_etter\\_emne/09nasjonal/](http://www.ssb.no/www-open/statistikk_etter_emne/09nasjonal/)

**Appendix A****Activity classification of the national accounts**

<b>Activity in national accounts</b>	<b>Standard Industrial Classification (NACE Rev. 1)</b>
<b>**** AGRICULTURE, FORESTRY AND FISHING</b>	
010 Agriculture	01.1+01.2+01.3
014 Agricultural and animal husbandry service activities, except veterinary activities	01.4
015 Hunting, trapping and game propagation including related service activities	01.5
020 Forestry, logging and related service activities	02
051 Fishing	05.01
052 Operation of fish hatcheries and fish farms	05.02
<b>**** OIL AND GAS EXTRACTION, MINING AND QUARRYING</b>	
100 Mining of coal and lignite; extraction of peat	10
111 Extraction of crude petroleum and natural gas	11.1
112 Service activities incidental to oil and gas extraction excluding surveying	11.2
130 Mining of metal ores	13
140 Other mining and quarrying	14
<b>**** MANUFACTURING</b>	
151 Production, processing and preserving of meat and meat products	15.1
152 Processing and preserving of fish and fish products	15.2
153 Processing and preserving of fruit and vegetables	15.3
154 Manufacture of vegetable and animal oils and fats	15.4
155 Manufacture of dairy products	15.5
156 Manufacture of grain mill products, starches and starch products	15.6
157 Manufacture of prepared animal feeds	15.7
158 Manufacture of other food products	15.8
159 Manufacture of beverages	15.9
160 Manufacture of tobacco products	16
170 Manufacture of textiles	17
180 Manufacture of wearing apparel; dressing and dyeing of fur	18
190 Tanning and dressing of leather; manufacture of luggage, handbags, saddlery, harness and footwear	19
201 Sawmilling and planing of wood, impregnation of wood	20.1
202 Manufacture of veneer sheets; manufacture of plywood, laminboard, particle board, fibre board and other panels and boards	20.2
203 Manufacture of builders' carpentry and joinery	20.3
204 Manufacture of wooden containers and other products of wood	20.4+20.5
211 Manufacture of pulp	21.11
212 Manufacture of paper and paperboard	21.12
213 Manufacture of articles of paper and paperboard	21.2
221 Publishing	22.1
222 Printing and service activities related to printing	22.2
223 Reproduction of recorded media	22.3
231 Manufacture of coke oven products	23.1
232 Manufacture of refined petroleum products	23.2
241 Manufacture of basic chemicals, excl. fertilizers and nitrogen compounds, plastics in primary forms and synthetic rubber	24.11+24.12+24.13+24.14
242 Manufacture of fertilizers and nitrogen compounds, pesticides and other agro-chemical products	24.15+24.2

**Activity in national accounts (cont.)****Standard Industrial Classification  
(NACE Rev. 1)**

243	Manufacture of paints, varnishes and similar coatings, printing ink and mastics	24.3
244	Manufacture of pharmaceuticals, medicinal chemicals and botanical products	24.4
245	Manufacture of soap and detergents, cleaning and polishing preparations, perfumes and toilet preparations	24.5
246	Manufacture of other chemical products	24.6
247	Manufacture of plastics and synthetic rubber in primary forms and man-made fibres	24.16+24.17+24.7
250	Manufacture of rubber and plastic products	25
261	Manufacture of glass and glass products	26.1
262	Manufacture of ceramic products, bricks, tiles etc.	26.2+26.3+26.4
265	Manufacture of cement, lime and plaster	26.5
266	Manufacture of articles of concrete, cement and plaster, non-metallic mineral products	26.6+26.7+26.8
271	Manufacture of iron, steel and ferro-alloys	27.1+27.2+27.3
273	Aluminium production	27.42
274	Manufacture of other non-ferrous metals	27.41+27.43+27.44+27.45
275	Casting of metals	27.5
281	Manufacture of structural metal products, tanks, reservoirs, steam generators	28.1+28.2+28.3
286	Manufacture of cutlery, tools and general hardware	28.6
287	Manufacture of other fabricated metal products etc.	28.4+28.5+28.7
291	Manufacture of machinery of mechanical power and other general purpose machinery	29.1+29.2
