Forms used in collecting the statistical returns	31

Introduction.

In "International Whaling Statistics III" we are submitting general statistics of the catch for the season 1930/31 and the summer of 1931. These statistics are quite complete. We have not, however, succeeded in obtaining returns of the yield from Chile, where a company has worked in previous years with a permanent station and four boats. The Committee has no knowledge as to whether the said company has been in operation at all in the season under review.

The majority of whaling companies have furnished measurement returns, which have been dealt with in the same manner as in "International Whaling Statistics II".

From The Administration of Greenland at Copenhagen we have received information concerning the Danish whaling off West Greenland in the years 1926—1931. The information given is printed as table no. 6.

In addition to the usual average measurements for each company's catch of blue-whale and fin-whale (companies are indicated by number instead of by name), this edition includes a table displaying the number of animals falling to each of the lengths specified in the table.

The whales are thereupon collocated in groups, with the percentage of animals falling to each group.

Lastly, a calculation is given of the percentage of the animals which have attained sexual maturity size.

The limit of sexual maturity is based on the results arrived at by N. A. Mackintosh and J. F. G. Wheeler, zoologists with the Discovery expedition, in the course of their investigations in the Antarctic.

The said authors have found that the blue-whale and the fin-whale have, as a rule, attained sexual maturity size at the following lengths:—

Blue females	77	feet	9	inches.
Blue males	74	"	2	"
Fin females	65	"	7	"
Fin males	63	"	8	"

In working up the measurement returns from the Antarctic we have referred the animals killed to three separate geographical fields:—

- (1) South Georgia and South Shetlands (permanent stations).
- (2) Pelagic catch in West Antarctic and eastward to approximately 85° to 90° E. lat.

(3) Pelagic catch from the mouth of Ross Sea and westward to approximately 85° to 90° E. lat., where the expeditions from the west and east got into contact with each other.

In this edition we are publishing a very large number of foetus measurements relative to blue-, fin- and sei-whales.

The tables show:—

(1) Date and year of measurement.

(2) Length of mother animal.

(3) Length of foetus.

(4) Number of foetuses falling to different groups of length in each month and average size of the foetuses measured in each month.

In respect of blue- and fin-whales, foetus measurements are included only from permanent stations on South Georgia and Deception Is. These measurements have been effected under conditions which should make them reliable.

It will be observed that in a number of instances whalers state mother animals of a length under that which should be the minimum for the attainment of sexual maturity according to the investigations made, as stated above, by the Discovery expedition.

As in previous editions of "International Whaling Statistics" the present publication also includes a table showing the economic utilisation of the whales killed.

These figures are worked out according to the number of barrels of oil produced per blue-whale unit.

The other whale species are converted into blue-whale in the following ratio:—

1 blue = 2 fin = $2\frac{1}{2}$ humpback = 6 sei-whales.

In the case of sperm-whale the number of barrels of oil produced from this species has been deducted in the total output.

Oslo 28th of June 1932.

Johan Hjort.

Gunnar Jahn.

Sigurd Risting.
