P R E F A C E

The present publication, International Whaling Statistics XXII, contains statistics covering the Antarctic whaling during the season 1947–48.

All the expeditions participating have sent in to the Committee the statistical data required according to the International Whaling Agreement. The statistics covering the Sovjet-Russian expedition arrived, however, too late to be included in all the tables. The tables recording the number of whales killed, the production of whale- and sperm-oil as well as the number of floating factories and catchers engaged, embrace all expeditions, while the tables giving the average size of whales killed, mature and immature animals, foetus-measurements, the catch by areas and by months do not include the Sovjet-Russian expedition. The Committee will, however, make the necessary corrections in later publications.

Oslo, 10th May 1949.

Birger Bergersen.

Harald B. Paulsen.

INTRODUCTION

Pelagic whaling in the Antarctic was carried on during the first post-war season 1945–46 with 9 floating factories and 77 catchers, and during the second post-war season with 15 floating factories and 129 catchers.

During the season 1947–48 17 floating factories were engaged with a total of 162 catchers. This whaling apparatus belonged to the various participating countries as follows:

Norway.....	9 fl. factories	and 85	catchers
England	3 "	"	35 "
South-Africa	1 "	"	14 "
Holland	1 "	"	8 "
Sovjet-Russia	1 "	"	8 "
Japan	2 "	"	12 "

During the 3 post-war seasons whaling was also carried on off South Georgia from 1 British, 1 Argentine and 1 Norwegian shore station. The number of catchers employed was 16 in 1945–46, 18 in 1946–47, and 21 in 1947–48.

At the international whaling conference in Washington in December 1946 the following resolution was adopted:

"All the provisions of the Protocol for the Regulation of Whaling signed in London on November 26, 1945, shall be made applicable as if in the said Protocol the words "season 1947–48" were substituted for the words "season 1946–47" and the words "1st May 1948 to 31st October 1948" were substituted for the words "1st May, 1947 to 31st October, 1947"."

The provisions of the Protocol of November 26th, 1945 which were made applicable also for the season 1947–48 were the following:

The whaling period for the pelagic expeditions was restricted to December 8th—April 7th, both days inclusive. The prohibition against killing of hump-backs in pelagic operations, agreed upon in the Protocol of 1938, was maintained.

The maximum catch of the pelagic expeditions should not exceed 16,000 blue-whale units, and in case this quota was reached before April 7th, the Committee for International Whaling Statistics should order operations to cease.

Otherwise, the regulations laid down in the International Whaling Agreement of 1937, with alterations as in the Protocol of 1938, were maintained.

During the seasons from 1934-35 until and including 1947-48 the catching periods for pelagic whaling in the Antarctic have been as follows:

Season 1934-35	December 1st—March 31st
1935-36	December 1st—March 15th
1936-37	December 8th—March 7th
1937-38	December 8th—March 15th
1938-39	December 8th—March 7th
1939-40	December 8th—March 7th
-----	-----
1945-46	November 24th—March 24th
1946-47	December 8th—April 7th
1947-48	December 8th—April 7th

In table a., above is given a survey of the Antarctic whaling results from 1919-20 until and including 1947-48. As will be seen from this table the result

¹⁾ For the seasons 1919/20-1930/31 the catch in the Ross Sea and from South Shetland and South Orkney is included in the figures for pelagic whaling in the Antarctic. ²⁾ Right-whales. ³⁾ 703 "Baleen whales" no specification given, 1 right-whale.

of the operations in 1947-48 was 31,318 whales killed and an oil production of 2,104,051 barrels of whale- and sperm-oil. The number of whales killed was considerable, approximately attaining the level of the seasons 1934/35-1936/37. The majority of the whales, in this season as well as in the previous ones, was killed in pelagic operations, namely 28,369 whales—as it will appear from table b, above. The number of whales killed per catcher was 171 for total Antarctic and 175 for the pelagic whaling, figures which do not indicate an essential decrease, even taking into consideration the higher average efficiency of the catchers, as compared with previous years. But although the total number of whales killed was relatively high in 1947-48, this does not apply to each of the various species.

The distinguishing factor of this season, more than during any previous season, is the low figure of blue-whales killed, considered absolutely and particularly by percentage.

Table c.—Whales caught in the pelagic whaling. Percentage figures.

Years.	Species of whales caught.					
	Blue.	Fin.	Hump-back.	Sei.	Sperm.	Total.
1927-28.....	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.

1936-37.....	43.2	40.5	13.6	0.1	2.6	100
1937-38.....	33.5	59.9	4.6	0.1	1.9	100
1938-39.....	37.8	53.1	2.4	—	6.7	100
1939-40.....	36.7	57.3	—	—	6.0	100
1940-41.....	31.9	45.7	17.3	0.1	5.0	100
1943-44.....	37.2	62.8	—	—	—	100
1944-45.....	57.3	42.6	—	0.1	—	100
1945-46.....	30.7	67.4	—	—	1.9	100
1946-47.....	38.5	55.9	—	—	5.6	100
1947-48.....	24.2	67.0	—	—	8.8	100

In the pelagic whaling 6,862 blue-whales were killed, and as will be seen from table c above this was only 24.2 per cent of all whales killed.

The dominating species of the last season's catch was the fin-whale, amounting to 67 per cent of the total catch. The relatively high number of sperm-whales killed, 2,494, may also be observed. It is the largest catch of sperm-whales ever made in the pelagic whaling in Antarctic. This sperm-whale catch had to a certain extent begun before the catch of baleen whales commenced. But also while the baleen-whale catch was carried on, a greater number of sperm-whales than usual was killed, due to the scarcity of baleen whales.

The decrease in the blue-whale catch obviously leads to a higher taxation of the fin-whale, if the production level is to be maintained.

In table d, page 11, is given a survey of the weekly catch during the seasons 1946-47 and 1947-48. This table has been based upon the weekly reports sent in to the Committee for International Whaling Statistics. As previously mentioned, page 7, it was left to the Committee for International Whaling Statistics to determine an earlier closing date of the whaling period in the season 1947-48, if it should appear that the maximum catch of 16,000 blue-whale units might be reached before April 7th, 1948. The Committee held a meeting on March 10th, 1948, and according to the weekly reports received, the total catch per March 6th, 1948 amounted to 13,435.5 blue-whale units. On the basis of the statistical data provided, the Committee determined the closing day to be March 31st 1948, and notified the Contracting Governments of that date. According to the weekly reports received, the total catch per

Table d.—Weekly catch of whales in blue-whale units.

5/4 "	628.9	31/3 "	474.7
7/4 "	105.0		
Total	15,337.9	Total	16,302.7

March 31st 1948 amounted to 16,302.7 blue-whale units (see table *d* above). By examining the statistical reports sent in by the companies to the Committee for International Whaling Statistics at the close of the season, pursuant to Article 17 in the Convention for the Regulation of Whaling, the total catch amounted to 16,364.3 blue-whale units.

The catching results by species of whales for the various months are given in absolute figures in table *e*, on page 12 and in percentage figures in table *f*, on page 13. It appears from table *e* that the blue-whale catch is lower for all months in 1947–48 than in 1946–47. The fin-whale catch, on the other hand, is much higher.

Table *g*, page 14, records the average size of whales killed as from the season 1936–37. The average size of blue-whales killed in pelagic whaling has been increasing during the 3 post-war seasons. In 1947–48 the average size was 78.45 Engl. feet, the highest average recorded since 1934–35. From the tables in previous publications it will appear that the average size of blue-whales killed in 1932–33 and 1933–34 was about 80.5 Engl. feet.

The average size of fin-whales killed in pelagic whaling during the post-war seasons is also somewhat larger than during the last pre-war seasons. In 1947–48 the average size of fin-whales killed was 67.93 Engl. feet, the highest average figure during the period covered by this table.

As mentioned in previous volumes of International Whaling Statistics several regulations have been in force since 1934–35, forbidding the killing of

Table e.—Antarctic, pelagic whaling. Catch by months in absolute figures.

whales below certain lengths. During the seasons 1934–35, 1935–36 and 1936–37 the minimum length of blue-whales was fixed at 65 feet, fin-whales at 50 feet and humpbacks at 35 feet. Since the season 1937–38, however, the minimum lengths have been fixed as follows:

Blue-whales	70	feet
Fin-whales	55	"
Humpbacks	35	"

These various regulations concerning the minimum length have obviously influenced the average size. In order to obtain comparable figures from season to season the average size has been calculated for a series of years in table *h*, page 15, deducting all blue-whales below 70 feet, all fin-whales below 55 feet and all humbacks below 35 feet.

According to Mackintosh and Wheeler the blue- and fin-whales generally reach maturity at the following lengths:

<i>Blue-whales:</i> Female	77	feet	9	inches
Male	74	"	2	"
<i>Fin-whales:</i> Female	65	"	7	"
Male	63	"	8	"

**Table h.—Average size of whales killed, by species and sex 1935/36—1947/48,

Total animals.	41.79	41.38	41.36	39.98	—	42.45	—	—	—	—	—	46.00

According to Harrison Matthews the humpbacks generally reach maturity at the length of 12.5 metres for female and 12 metres for male. Converted to English measures these lengths equal

Female 41 feet
Male 39 " 4 inches

On the basis of these maturity limits a calculation has been made in table *i*, on page 16, of the catch of mature and immature whales. As the measurement reports sent in by the companies are given in feet only, the maturity limits mentioned above are also rounded off to feet.

In spite of the fact that the average size of blue-whales has increased slightly in 1947-48 compared to 1946-47, table *i* nevertheless shows a somewhat higher percentage of immature blue-whales. The season 1947-48 recorded 28.42 per cent immature blue-whales against 26.87 per cent in 1946-47. Both these percentages are slightly lower than during the pre-war seasons.

The table indicates 13.90 per cent immature fin-whales, which is lower than during any season from 1936-37.

Tables *j* and *k*, on pages 17 and 18, give the catch in the various areas from the season 1933-34. These areas are distinguished as follows:

Area II between	0°	and	60°	west	
" III "	0°	"	70°	east	
" IV "	70°	east	and	130°	east
" V "	130°	"	"	170°	west

The waling results recorded in 1939-40 and 1940-41 are not complete as the Committee for International Whaling Statistics did not receive reports from all the companies, owing to the war.

It will appear from table *j*, on page 17, that the blue-whale catch in 1947–48 was very equally distributed in all 4 areas, the figures varying between 1,490 and 1,785 whales. The fin-whale catch, however, amounted to 5,951 in area II, 6,071 in area III, and 6,249 in the areas IV and V together.

Table *k* above gives summary statements of the catch for the various areas from 1933–34 until 1947–48. It appears from table *k* 1 that the largest blue-whale catch in the said period has been in area III, representing 41.61 per cent of all blue-whales killed. The largest fin-whale catch, on the other hand,

¹⁾ Including the production from "Deception". ²⁾ Including the production of the aux. factory "Ole Wegger".

has been made in area II, with 40.80 per cent of the total of fin-whales killed. Of the total of whales killed the largest part, or 39.29 per cent, refers to area III.

From table k 2 will be seen that the catch in area II has consisted of 31.78 per cent blue-whales and 64.55 per cent fin-whales, in area III of 44.97 per cent

¹⁾ Right-whale.

blue-whales and 45.37 per cent fin-whales, and in area IV of 50.82 per cent blue-whales and 35.87 per cent fin-whales. In all areas the total catch in this period has consisted of 42.46 per cent blue-whales, 48.92 per cent fin-whales, and humpbacks and sperm-whales together 8.62 per cent.

In table l, page 18, is given the average size of floating factories and catchers engaged in pelagic whaling in the Antarctic from and including the season 1933-34.

As will be seen, the average size of the floating factories has increased from 13,212 gross tons in 1946-47 to 13,809 gross tons in 1947-48.

The average gross tonnage and average I. H. P. of the catchers has constantly increased since 1933-34, and the average capacity of the catchers operating in 1947-48 was 347 gross tons and 1,379 I. H. P. During the season 1933-34 the corresponding figures were 256 gross tons and 883 I. H. P.

The considerable increase in the size and engine power of the catchers and the much better technically equipped floating factories, obviously means a far more efficient whaling apparatus in comparison with that of previous seasons.

Table m, on page 19, shows the average production of whale oil per floating factory and catcher from 1925-26 to 1938-39 and from 1945-46 to 1947-48. The

war seasons 1939/40–1944/45 are not included in this table, owing to the reduced whaling activity and the difficulty in obtaining complete statistics during these seasons. For the first two seasons, 1939–40 and 1940–41, the statistical material available is too incomplete to give a correct picture of the average production. In 1941–42 no pelagic whaling was carried on in the Antarctic. During the seasons 1942–43 and 1943–44 one single expedition was operating, and the whaling results for this expedition are not adequate for a reliable judgement of the presence of whales during these two seasons. Table *m* covers the production of whale-oil only, not including the sperm-oil production.

It will appear from table *m I* that the average production per floating factory in 1932–33 amounted to 140,885 barrels of oil. During the subsequent seasons the average production per factory decreased, but during the last two seasons there has again been some increase. When analysing the average production, the varying lengths of the different periods must obviously be considered. A better indicator of the development is the average daily production per floating factory. These figures are recorded in the last column of table *m I*. As will be observed the average daily production per floating factory amounted to about 900 barrels during the seasons 1932/33–1936/37. During the season 1937–38 the figure increased to 1,014 barrels and in 1946–47 it amounted to 1,039 barrels, whereafter it decreased to 957 barrels during the season 1947–48. When judging the average daily production per floating factory, the varying number of catchers engaged by the floating factories during these seasons must be taken into consideration. The tendency, particularly during the post-war seasons, has been towards an increased number of catchers per floating factory.

Table *m II* records the average production per catcher during the various seasons, and the average daily production per catcher. The average production per catcher reached maximum in 1932–33, with 21,384 barrels. The average catching period was then, as will be seen from the table, 148 days. During the seasons subsequent to 1932–33 the average production per catcher per season constantly decreased, this being, however, partly due to a curtailed catching period. In 1946–47 the average production per catcher amounted to 13,398 barrels and the average catching period was 113 days.

During the season 1947–48 the average production amounted to 11,170 barrels and the average catching period was 110 days per catcher. In the last column of table *m II*, the average daily production per catcher has been calculated. This average production reached a maximum in 1933–34 with 159 barrels. In 1946–47 the corresponding figure was 118 barrels and in 1947–48 101 barrels. This decrease in the average daily production per catcher is even more significant when taken into consideration the constantly increasing efficiency of the catchers engaged. As will appear from table *l* on page 18, the average per catcher of I.H.P. amounted to 883 in 1933–34, while the corresponding average in 1946–47 amounted to 1,266 and in 1947–48 to 1,379. The engine power of the catchers

in 1947–48 has consequently increased by 56.36 per cent as compared to 1933–34. During the same period the production has decreased by 36.48 per cent.

Table *n* on page 20, gives the pelagic whaling results for the various countries for a series of years. As will be seen from this table, Norway and the British Empire are predominating in respect to the number of whales killed and oil production as well as to the catchers employed.

South Georgia.

In the season 1947–48 3 shore stations with a total of 21 catchers carried on whaling off South Georgia. The catch amounted to 2,949 whales killed, yielding an oil production of 163,398 barrels of whale- and sperm-oil. As it will appear from table *o*, on page 21 the blue-whale catch has decreased, while the catch of fin- and sei-whales has increased. 609 sei-whales were killed, but in respect to the output of oil this equals 101.5 blue-whales or 203 fin-whales only.

Tables *p* and *q*, on pages 22–23, give the catch off South Georgia by months in absolute and percentage figures from and including 1938–39, and table *r*, on page 24 shows the proportion between mature and immature whales.

The total whaling results in the Antarctic are in table *s* next page distributed in respect to the various participating countries. It appears from this table that Norway's part of the total oil production in 1947–48 amounted to 49.9 per cent and that of the British Empire to 36.1 per cent.

Table *t* below records the average output of oil per blue-whale unit (1 blue-whale unit = 1 blue-whale = 2 fin-whales = 2½ humpbacks = 6 sei-whales) for pelagic operations and for the land-stations at South Georgia.

For the pelagic expeditions the average production per blue-whale unit in 1947–48 was about 2 barrels lower than that of the previous season. For South Georgia the average production per blue-whale unit was 128.3 barrels—the largest average output ever recorded for these stations.

¹⁾ Barrel = 1/6 ton (ton = 1,016 kg). ²⁾ Including the catch of two Norwegian expeditions hired by Germany—in 1936-37 1,756 whales, in 1937-38 2,158 whales, and in 1938-39 1,658 whales. ³⁾ Including the production of two Norwegian expeditions hired by Germany—in 1936-37 134,200 barrels, in 1937-38 180,750 barrels, and in 1938-39 118,380 barrels.

The average *weekly* production per blue-whale unit for the pelagic expeditions during the seasons 1946–47 and 1947–48 is recorded in the table *u* below. This table covers the production of whale-oil only (sperm-oil not included). The table is not quite complete as figures for the production of the Sovjet-Russian floating factory “Slava” are lacking.

Table u.—Average weekly production of whale-oil per blue-whale unit in the pelagic whaling 1946–47 and 1947–48.

7/4 "	17,380	74.0	234.9				
Total	1,689,044	15,003.8	112.6	Total	1,753,146	15,800.0	111.0

According to this table, the output during the last week of operation in 1946–47 amounted to 234.9 barrels per blue-whale unit and in 1947–48 to 170.6 barrels. All reservations must be taken in respect to these figures, they are probably much higher than the actual production of that week. At the close of the season the expeditions are gauging their oil tanks again, in order to determine the quantity of oil as exactly as possible. It then often appears that the production exceeds the previously stated data with some thousand barrels, and this “surplus” is then included in the production report of the last week of operation.

During the season 1947–48 8,697 men were employed in the Antarctic whaling industry. Of these 5,994 were Norwegians, 991 Japanese, 695 British, 461 Russians, 105 South-Africans, and 451 of other nationalities.
