P R E F A C E

The present publication, International Whaling Statistics XXIV, contains statistics covering the Antarctic Whaling during the season 1948–49.

All the expeditions participating have sent in to the Committee the statistical data required according to the International Convention for the Regulation of whaling with exception of the U.S.S.R. floating factory "Slava", whose statistical records are only complete as far as the number of whales killed, the oil production and the whaling equipment engaged, is concerned. The "Slava's" statistical data give no information as to the size and sex of the animals and where the pelagic operations have been carried on. The tables recording the number of whales killed, the production of whale- and sperm-oil and the number of floating factories and catchers engaged, therefore embrace all expeditions, while the tables giving the average size of whales killed, mature and immature animals, foetus-measurements, the areas covered and the monthly data do not include the U.S.S.R. expedition.

Oslo, 20th May 1950.

Gunnar Jahn.

Birger Bergersen.

Harald B. Paulsen.

INTRODUCTION

During the Antarctic season 1948–49 18 floating factories, 3 shore stations and 212 catchers carried on whaling. This surpassed the fleet operating during the 1947–48 season by 1 floating factory and 29 catchers. The whaling apparatus in 1948–49 belonged to the following participating countries as follows:

Norway.....	10	floating factories,	1	shore station,	108	catchers		
United Kingdom	3	"	"	1	"	"		
Union of South-Africa	1	"	"			14	"	
The Netherlands	1	"	"			10	"	
U.S.S.R.	1	"	"			12	"	
Japan	2	"	"			14	"	
Argentina				1	"	"	7	"

The International Convention for the Regulation of whaling of December 2nd 1946 came into force on November 10th 1948, having then been ratified by the following countries: The Netherlands, Norway, The Union of Soviet Socialist Republics, The United Kingdom of Great Britain and Northern Ireland, The United States of America, Australia, The Union of South-Africa and Iceland.

The regulations laid down in the International Whaling Convention are on the whole in accordance with the International Whaling Agreements being in force from 1937–38 until and including 1947–48. Of the more important regulations concerning the Antarctic whaling may be mentioned:

1. The maximum pelagic catch of baleen whales shall not exceed 16,000 blue-whale units. 1 blue-whale unit = 1 blue-whale = 2 fin-whales = $2\frac{1}{2}$ humpbacks = 6 sei-whales.
2. For 1948–49 the whaling period for the pelagic expeditions was restricted to December 15th 1948—April 1st 1949. For 1949–50 the whaling period has been fixed to December 22nd 1949—April 7th 1950. The whaling period for the shore stations is 6 months.
3. It is forbidden to take or kill

blue-whales	below	70	feet
fin-whales	"	55	"
sei-whales	"	40	"
humpback-whales	"	35	"
sperm-whales	"	35	"

27/3 "	796.0		
31/3 "	474.7		
Total	16,302.7	Total	15,926.0

It is also forbidden to take or kill right-whales and female whales accompanied by calves or suckling whales.

4. It is forbidden to use a floating factory or a catcher attached thereto for the purpose of taking or treating baleen whales in the waters south of 40° South Latitude from 70° West Longitude westward as far as 160° West Longitude.
5. It is forbidden to use a floating factory or a catcher attached thereto for the purpose of taking or treating humpbacks in any waters south of 40° South Latitude. During the seasons 1949–50 and 1950–51 it is permitted to kill 1,250 humpbacks each season.

The Committee for International Whaling Statistics has been commissioned to order operations to cease if the maximum catch of 16,000 blue-whale units may be reached before the official closing day, which for the season 1948–49 was fixed at April 1st. In accordance with the provisions of Article VII of the Convention weekly notifications have been sent in to the International Bureau for Whaling Statistics by all expeditions, recording the number of blue-whale units taken. Table a, above, gives a survey of the weekly catch based on the reports received during the last two seasons.

On March 5th 1949 the Committee for International Whaling Statistics held a meeting, and according to the weekly reports received, the catch per February 26th 1949 amounted to 12,540 blue-whale units. On the basis of

Table b.—Number and gross tonnage of floating factories and catchers engaged in pelagic whaling in the Antarctic 1933/34—1948/49.

Seasons	Floating factories			Catchers

1936–37....	30	370,380	12,346	184	51,888	282	1,028
1937–38....	31	408,332	13,172	244	71,980	295	1,107
1938–39....	34	467,534	13,751	270	80,460	298	1,139
1939–40....	28	382,650	13,666	238	70,954	298	1,127
1940–41....	11	163,725	14,884	86	27,520	320	1,206
— —	—	—	—	—	—	—	—
1943–44....	1	14,362	14,362	8	2,180	310	1,238
1944–45....	1	12,215	12,215	8	2,180	310	1,238
1945–46....	9	123,499	13,722	77	24,326	316	1,239
1946–47....	15	198,179	13,212	129	41,301	320	1,266
1947–48....	17	234,759	13,809	162	56,156	347	1,376
1948–49....	18	254,406	14,134	191	76,272	399	1,562

calculations the Committee determined operations to cease at midnight on March 26th. According to the preliminary reports the total catch per March 26th amounted to 15,926 blue-whale units. By examining the statistical data sent in by the companies at the close of the season (see table d) it appears that the total catch of the pelagic expeditions amounted to:

$$\begin{aligned}
 7,399 \text{ blue-whales} &= 7,399 \text{ blue-whale units} \\
 17,202 \text{ fin-whales} &= 8,601 \quad " \quad " \\
 13 \text{ humpbacks} &= 5.2 \quad " \quad " \\
 15 \text{ Sei-whales} &= 2.5 \quad " \quad "
 \end{aligned}$$

Total 16,007.7 blue-whale units

The discrepancy between the weekly reports and the above aggregate figures is due to the fact that the majority of the expeditions do not include whales lost after having been flagmarked or whales lost after delivery to the floating factory.

The result of the previous season 1947–48 amounted to 16,302.7 blue-whale units according to the weekly reports, while the total catch according to the final statistics of the expeditions amounted to 16,364.3 blue-whale units. In this season operations ceased on March 31st 1948.

As it will be observed, the Committee has—for these 2 seasons—succeeded in limiting the catch as closely as at all possible to 16,000 blue-whale units.

During the period 1934–35 until and including 1948–49 the whaling periods for the pelagic expeditions in the Antarctic have been as follows:

Season 1934—35.....	December	1st—March 31st
1935—36.....	December	1st—March 15th
1936—37.....	December	8th—March 7th
1937—38.....	December	8th—March 15th
1938—39.....	December	8th—March 7th
1939—40.....	December	8th—March 7th
— — —		
1945—46.....	November	24th—March 24th
1946—47.....	December	8th—April 7th
1947—48.....	December	8th—March 31st
1948—49.....	December	15th—March 26th

The whaling period for the last season lasted in other words 102 days, which is 13 days less than for the season 1947—48. In the season 1948—49 the whaling period commenced 7 days later and closed 5 days earlier than in the previous season. The whaling period is the one important factor to be considered

¹⁾ For the seasons 1919/20-1930/31 the catch in the Ross Sea and from South Shetland and South Orkney is included in the figures for pelagic whaling in the Antarctic. ²⁾ Right-whales. ³⁾ 703 "Baleen whales" no specification given, 1 right-whale.

when analysing the whaling results. Another important factor is the number of catchers engaged. As previously mentioned 212 catchers were operating in the Antarctic during the last season, of which 191 in pelagic whaling. These catchers were employed by 18 floating factories. That was 1 floating factory more than in 1947-48, while the number of catchers had been increased by 29.

From table b, on page 9, it will be observed that the number of floating factories employed is much lower now than before the war. This is also the case as far as the number of catchers is concerned. The average number of catchers per floating factory, however, amounted to 10.6 during the last season, while the highest number reached during the last pre-war seasons was 7.9. At the same time the capacity of the catchers has constantly increased, measured by average gross tonnage as well as by engine power. Before the last war the average gross tonnage did not reach 300 gross tons. During the last season the figure was 399. The average engine power, measured by I. H. P. was before the last war well over 1,100, and during the last season 1,562. This considerable rise in the size

Table e.—Average production per floating factory and catcher in the pelagic whaling in Antarctic 1925/26—1948/49 (exclusive of the war seasons).

and engine power of the catchers obviously means a far more efficient whaling apparatus as compared with that of previous years.

In table c, on page 10 is given a survey of the Antarctic whaling results from 1919-20 until and including 1948-49. As will be seen from this table the result of last season's operations was 31,262 whales—approximately the same figure as that of the previous season. That is a remarkably high number of whales killed. Only during 4 previous seasons—1930-31, 1936-37, 1937-38, and 1938-39—essentially higher results have been obtained. This must be taken into consideration when judging the tax imposed upon the stock of whales. The oil production was also considerable—2,206,594 barrels—but it did not attain the level of the production in the 1929/30—1939/40 seasons. It must be observed that the sperm-oil during the last season formed a larger portion of the total oil production than generally before the last war.

Table c shows the results of all whaling operations in the Antarctic, but the whaling from the shore stations is quite insignificant in comparison with the pelagic operations. A survey of the pelagic whaling is recorded in table d, on page 11.

The pelagic whaling resulted in 28,321 whales killed, which is also a very high figure. Approximately the same number of whales was killed during the season 1947-48. The distinguishing factor of the season 1948-49 is the high number of sperm-whales killed, the total catch amounting to 3,692 sperm-whales. This is the highest figure ever recorded in respect to the sperm-whale during one single season in the Antarctic. The catching of sperm-whales, being unrestricted by time limitations, begins before the opening of the baleen-whale season, but

the greater number of sperm-whales killed is mainly due to the high prices of sperm-oil during the latest years.

The catch of baleen whales, which is of the greatest importance in these waters, decreased during the last season to 24,629 animals, as compared to 25,875 in 1947-48. However, when examining the whaling results, the total number of whales killed or the number of whales killed per catcher is of little value as a basis of comparison—as the whaling period has been curtailed, and also because the efficiency of the catchers has increased.

A better indication is given in table e, on page 12, which records a survey for a series of years of the average daily oil production per floating factory and per catcher. But as the daily oil production per floating factory depends on the species of whales killed as well as on the productive capacity of the factories, even these data will not give an exact expression of the whaling results.

The most reliable figures illustrating the development are those recorded in the last column of table e, II, of the average daily number of baleen whales killed per catcher (average number of baleen whales killed per catcher's day-work). These particulars indicate that the average daily result per catcher during the last season was 1.29 baleen whales. This is the lowest figure recorded since the season 1930-31, and the corresponding data for the other post-war seasons have never attained the level of the later thirties. This declining rate, the increased efficiency of the catchers notwithstanding, may be taken as a proof of a decrease in the stock of whales in the Antarctic.

**Table j.—Average size of whales killed, by species and sex 1937/38—1948/49,
excl. of blue-whales less than 70', fin-whales less than 55' and humpbacks less than 35'.

The predominant species of the baleen whales taken in Antarctic waters are blue- and fin-whales. As there has been no killing of humpbacks in any of the post-war seasons, the catch of baleen whales has consisted exclusively of the two above mentioned species.

In table *f*, on page 13 is given the relation between the various species of whales killed in pelagic operations in the Antarctic as from the season 1927–28. From this table it will be observed that the dominating species from the season 1927–28 until and including 1936–37 was the blue-whale, but for all later seasons except one, the fin-whale catch has formed the greatest portion of the total proceeds. This has been particularly the case during the post-war seasons, and in spite of a slight increase in the blue-whale catch during the last season as compared with 1947–48, the number of blue-whales killed is still in 1948–49 considerably lower than the number of fin-whales. The curtailment of the whaling period may have been an influencing factor in respect to the altered correlation between the blue- and fin-whale catch. On the other hand, the monthly figures recorded in absolute and percentage figures in tables *g* and *h*, on pages 14 and 15 do not indicate this factor to be the main cause of the decreasing blue-whale catch.

However, it is here particularly desirable to emphasize the decrease in the fin-whale catch from 1947–48 to 1948–49 in respect to January/February, these two months being completely covered by the whaling period during both seasons, and consequently the figures recorded being directly comparable. Notwithstanding the increase in the blue-whale catch, the whaling results of the different months seem to indicate that also the stock of fin-whales has been heavily taxed.

The Committee wants to draw the attention to the fact that monthly particulars are not yet available for the U.S.S.R. floating factory "Slava" for

the season 1948–49. The corresponding figures for 1947–48 reached the Committee too late to be included in Volume XXII of Int. Whaling Statistics. They have, however in the present publication been included in the tables *g* and *h*.

The tables *i* and *j*, on pages 16 and 17, record the average size of whales killed from 1937–38. The particulars from "Slava's" expedition are not yet available for 1948–49, but the figures for 1947–48 have been revised and now include all pelagic whaling during that season.

According to table *i* the average size of blue-whales killed has increased from 78.42 feet in 1947–48 to 79.12 feet in 1948–49. The average size of fin-whales was 67.96 feet in 1948–49 as compared to 67.94 feet during the previous season. Only 13 humpbacks were killed.

Since the season 1937–38 the minimum lengths, settled by international agreements, have been decided upon as follows:

Blue-whales	70	feet
Fin-whales	55	"
Humpbacks	35	"

During each season a certain number of animals below these lengths is killed. As a variation in the number of these undersized whales killed will influence

the average size of all animals killed, all blue-whales below 70 feet, all fin-whales below 55 feet and all humpbacks below 35 feet have been omitted from the calculations of the average lengths in table *j*.

One must here observe the increasing tendency of the average size. The average size both of the blue-whales and the fin-whales killed during the last seasons has been higher than in the pre-war seasons.

This tendency is expressed in a different way in the particulars recorded for mature and immature animals, in table *k*, on page 18. Regarded as immature animals are:

Blue-whales: Female	76	feet and less
Male	73	" "
Fin-whales: Female	64	" "
Male	62	" "
Humpbacks: Female	40	" "
Male	39	" "

On the basis of these maturity limits, the figures calculated show that 23 % of all blue-whales killed in 1948—49 was immature, i.e. a decrease in immature blue-whales of 5.62 % as compared to 1947—48. On the whole, during the 4 post-war seasons the percentage of immature animals killed has been lower than during the last pre-war seasons. This is also the case in respect to the fin-whale. This is probably due to the interval in the whaling activities during the war. In other words, the whales killed during the post-war seasons are of the stock preserved during the war years. The future will show how long these age-groups will be able to influence the whaling results.

Tables *l* and *m*, on pages 19 and 20, give the catch in the various areas from the season 1933—34. These areas are distinguished as follows:

Area	I	between	60° west	and	170° west
"	II	"	0°	"	60° west
"	III	"	0°	"	70° east
"	IV	"	70° east	and	130° east
"	V	"	130°	"	170° west

As previously mentioned pelagic whaling is forbidden between 70° west and 160° west, which limits the pelagic operations in area I to 60° west—70° west and 160° west—170° west only. During the season 1948—49 27 blue-whales and 13 fin-whales were killed in area I. Beyond this no whaling was carried on in this area during the period covered by the tables. For space-saving reasons area I has not been included in table *l*.

The data concerning 1947—48 in table *l*, in this publication include the particulars relating to "Slava", whereas these are lacking in the 1948—49-figures. In

Table n.—Antarctic, pelagic whaling results for the various countries 1935/36—1948/49.

¹⁾ Right-whale.

1948-49 the largest number of blue-whales was killed in Area III, viz. 2,825 animals or 39.48 %. In Area II the corresponding figures were 1,963 whales or 27.43 %. In Areas IV and V respectively 1,325 and 1,016 blue-whales were killed.—The largest fin-whale catch in 1948-49 took place in Area III, viz. 6,257 animals or 38.24 % of all fin-whales killed. In Area II 4,486 fin-whales were killed, or 27.42 %.

Table m gives a summary of the whaling results in the various areas for the period 1933/34—1948/49. As it will appear from this table, the largest blue-whale catch has taken place in Area III, whereas the largest fin-whale catch has taken place in area II.

Table n, on page 22, gives a survey of the pelagic whaling results of the various countries 1935/36—1948/49. As will be seen from this table, Norway and the British Commonwealth are predominating in respect to the number of whales killed and oil production as well as to the catchers employed.

Table p.—South Georgia. Catch by months in absolute figures.

South Georgia.

The whaling results of the shore stations operating off South Georgia are recorded in table *o*, on page 23.

In 1948–49 as in 1947–48 3 shore stations with a total of 21 catchers carried on whaling off South Georgia. The catch amounted to 2,941 whales yielding an oil production of 162,964 barrels of whale-oil and 9,175 barrels of sperm-oil. The average number of whales killed per catcher amounted to 140 animals also during the last season.

Tables *p* and *q*, on pages 24 and 25, give the catch off South Georgia by months in absolute and percentage figures from and including 1939–40, and table *r*, on page 26, shows the proportion between mature and immature whales.

The total whaling results in the Antarctic in the seasons 1935–36 up to and including 1948–49 are in table *s* on pages 28 and 29 distributed in respect to the various participating countries. It appears from this table that Norway's part of the total oil production in 1948–49 amounted to 50.2 per cent and that of the British Commonwealth to 34.3 per cent.

Table *t* below records the average output of oil per blue-whale unit for pelagic operations and for the shore stations at South Georgia.

For the pelagic expeditions the average production per blue-whale unit amounted to 115.6 barrels in 1948–49 against 111.2 barrels in 1947–48. For South Georgia the average production per blue-whale unit was also in 1948–49 very high.

Table *u*, on page 30, is recording the average *weekly* production per blue-whale unit for the pelagic expeditions during the seasons 1947–48 and 1948–49.

This table shows the increasing average output per blue-whale unit as the

Table t.—Average production of oil per blue-whale unit.¹⁾

season proceeds. While the production medio December is about 85 barrels, it is steadily increasing up to about 140 barrels in March.

All reservations must be taken in respect to the figures recorded for the last week of operation during these two seasons. At the close of the season the expeditions are sounding their oil tanks for controlling purposes, and it then usually appears that the production exceeds the previously stated data with some thousand barrels, and this "surplus" is then included in the production report of the last week of operation.

Table *u* excludes the "Slava" expedition, as weekly reports are lacking.

During the season 1948—49 10,166 men were employed in the Antarctic whaling industry. Of these 6,926 were Norwegians, 1,065 Japanese, 824 British, 640 Russians, 283 South-Africans and 428 of other nationalities.
