P R E F A C E

The present publication, International Whaling Statistics No. XXVI, contains statistics covering the Antarctic whaling during the season 1949–50.

All the expeditions participating have sent in to the Committee the statistical data required according to the International Convention for the Regulation of Whaling.

When the statistics for the season 1948–49 (publication No. XXIV) was prepared, the reports provided by the U.S.S.R. floating factory "Slava" contained no information as to the size and sex of the whales killed. These data are now available and the tables published in No. XXIV have been revised accordingly.

Oslo, 15th April 1951.

Harald B. Paulsen.

INTRODUCTION

During the Antarctic season 1949–50 18 floating factories and 3 shore stations carried on whaling with a total of 237 catchers. The floating factories and shore stations under consideration are identical with those in operation during the season 1948–49, but they employed 25 additional catchers this last season. The whaling apparatus in operation in 1949–50 belonged to the following countries: —

Norway	10	floating factories,	1	shore station,	126	catchers	
United Kingdom ...	3	»	»	1	»	48	»
Union of South Africa	1	»	»			15	»
Japan	2	»	»			16	»

Total						18	floating factories, 3 shore stations, 237 catchers

All the countries participating in the Antarctic whaling in 1949–50 have ratified the International Convention for the Regulation of whaling of 1946 and approved the alterations agreed upon at the meeting of the International Whaling Commission in London in 1949. Consequently, all the expeditions were subject to the same regulations in force. The most important of these regulations concerning pelagic whaling in 1949–50 are as follows:—

1. Catching period for baleen whales was from December 22nd 1949 to April 7th 1950. With regard to the closing day for baleen whale hunting attention is drawn to what is stated in paragraph 2.
2. Catch of baleen whales was not to exceed 16,000 blue-whale units. (As one blue-whale unit is reckoned 1 blue-whale or 2 fin-whales or 2½ humpbacks or 6 sei-whales.) The Contracting Governments were to send in weekly reports of the catch converted into blue-whale units. On the basis of the reports received the Bureau of International Whaling Statistics was to terminate the baleen whale operations by 14 days' notice if the permissible number of blue-whale units might be presumed to be caught before April 7th 1950.

3. Pursuant to the Convention of 1946 the pelagic taking of humpbacks in the Antarctic had been prohibited. At the meeting of the Whaling Commission in London in 1949 it was decided that the pelagic expeditions could in each of the seasons 1949–50 and 1950–51 take 1,250 humpbacks. The expeditions were to send in weekly reports direct to the Bureau of International Whaling Statistics, which body on the basis of the reports received was to terminate the humpback whaling operations by at least 4 days' notice, when the permissible number of humpbacks might be presumed to be caught.

4. It was forbidden to take

blue-whales	under 70 feet		
fin-whales	»	55	»
sei-whales	»	40	»
humpbacks	»	35	»
sperm-whales	»	35	»

Further it was forbidden to take grey-whales or right-whales or female whales accompanied by a calf. The Convention contained also a provision enjoining full utilization of whales.

5. Pelagic whaling was prohibited between 70° West Longitude and 160° West Longitude.

The whaling period for the shore stations on South Georgia was 6 months, and the regulations laid down in pt. 4 above were in force.

Pursuant to the International Agreement for the Regulation of Whaling the pelagic killing of humpbacks in the Antarctic has been prohibited from and including 1938–39. As mentioned above under pt. 3 it was decided at the meeting of the Whaling Commission in London in 1949 that the pelagic expeditions could in each of the seasons 1949–50 and 1950–51 take 1,250 humpbacks. The resolutions 11 and 12 relating to pelagic whaling of humpbacks read as follows:—

“Resolution 11.

That the regulation forbidding the taking of humpback whales by factory ships south of 40° South Latitude be amended so that a maximum of 1,250 humpback whales may be taken in this region during each of the pelagic whaling seasons 1949–50 and 1950–51.

Resolution 12.

That in pursuance of the provisions of Article VII of the Convention, notification of data on the number of humpbacks taken shall be reported directly from the expeditions to the Bureau of International Whaling Statistics, Sandefjord, Norway, within two days after the end of each

calendar week. The Bureau of International Whaling Statistics shall determine on the basis of the data provided, the date on which the maximum catch of humpbacks shall be deemed to have been reached. The expeditions shall be notified directly four days before the closing date. Simultaneously, notification shall be sent to the Contracting Governments and to the Commission."

It appears from resolution 12 that the pelagic expeditions were to send in weekly reports of the humpback catch direct to the Committee for International Whaling Statistics. On the basis of the reports received this Committee was to determine the closing date of the humpback whaling operations by giving at least 4 days' notice. The humpback whaling commenced on December 22nd 1949 and terminated on January 3rd 1950, the catch at that date amounting to 2,117 whales, i.e. an excess of the maximum quota of 867 humpbacks. This considerable excess is due to the fact that the expeditions, pursuant to the regulations, were to provide *weekly* reports only. The first report received by the Committee covered the period 22nd–24th December 1949. The pelagic expeditions, excepting the floating factory "Slava", had during these three days killed a total number of 237 humpbacks, or an average per day of about 80 whales. Based on this average, the maximum catch agreed upon would be reached in 16 days—in other words the humpback whaling might continue until January 7th 1950. The Committee for International Whaling Statistics, however, was of the opinion that the report per 24th December, covering the results of 3 days' catch only, was inadequate as a basis for determining the length of the whaling period. The Committee assumed that the whaling results of the first 3 days were far below reasonable anticipations, possibly due to unfavourable weather conditions. However, in accordance with the regulations laid down in the Convention, the expeditions were not to send in their next reports until December 31st. These could not reach the Committee before January 2nd, and the earliest possible closing day of the humpback season would consequently be about January 6th. The Committee therefore decided to request all the pelagic expeditions to send in reports of the humpback catch per December 29th 1949, and to the great satisfaction of the Committee every single expedition complied with this request. Per December 29th the number of humpbacks killed amounted to 976, i.e. an increase during the last 5 days of 739 whales or an average of 148 whales per day. The Committee assumed that the maximum quota would have been killed before December 31st, but as the closing day had to be given by at least 4 days' notice, the earliest date possible could be fixed at January 3rd. The humpback whaling ceased on January 3rd 1950, and according to the telegraphic reports the catch then amounted to 2,096 humpbacks. That was an increase of 1,120 humpbacks during the last 5 days of operation, or 224 whales per day.

As it will appear, the number of humpbacks killed increased considerably during the last days of the operations. It may, for instance, be mentioned that one of the expeditions with a total catch of 528 humpbacks, killed 331 animals during the last 5 days.

The final statistical reports provided by the expeditions after their return in the spring 1950 showed that the total number of humpbacks killed amounted to 2,117. In order to avoid a similar considerable excess of the maximum quota of humpbacks allowed for the season 1950–51, the Committee for International Whaling Statistics at the last meeting of the Whaling Commission suggested that the expeditions send in daily reports, and this suggestion was adopted. Further, the Commission passed the resolution that the taking of humpbacks during the season 1950–51 was not to commence until February 1st 1951.

Pursuant to the regulations laid down in the International Convention the expeditions are obliged to send in weekly reports of the catch, converted into blue-whale units to the Committee for International Whaling Statistics. From 17 expeditions the Committee received these reports within 2 days after the end of each calendar week. From the 18th expedition the report did not usually arrive until 8–10 days after the end of the calendar week.

Table *a*, below, gives a survey of the weekly catch during the 3 last seasons based on the telegraphic reports. On February 23rd the Com-

mittee for International Whaling Statistics held a meeting to discuss the eventual closing day of the pelagic whaling of baleen whales. According to telegraphic reports received, the catch per February 18th 1950 amounted to 12,037.6 blue-whale units. Report from one expedition, concerning the week 12th–18th February, was not at that time available and consequently had to be estimated. On the basis of the whaling results per February 18th and considering the fact that the catch during the later part of the season generally is lower than the average catch during the first part of the season, the Committee decided that operations should cease at midnight on March 15th. According to the preliminary reports the total catch per March 15th amounted to 16,011.2 blue-whale units. By examining the statistical data provided by the companies at the close of the season, it appears that the total catch of the pelagic expeditions amounted to:—

6,168	blue-whales	=	6,168	blue-whale units	
18,061	fin-whales	=	9,030.5	—»—	
2,117	humpbacks	=	846.8	—»—	
101	sei-whales	=	16.8	—»—	
<hr/>					
Total	26,447	whales	=	16,062.1	blue-whale units

The discrepancy between the weekly reports recorded in table *a* and the above aggregate figures is due to the fact that the majority of the expeditions do not include in their weekly reports whales lost after having been flagmarked.

Order to cease operations prior to the official closing day has now been given for 3 seasons in succession. During these seasons the total catch has amounted to:—

1947–48	16,364.3	blue-whale units
1948–49	16,007.4	—»—
1949–50	16,062.1	—»—

The total excess of the maximum quota during these 3 seasons amounts to 433.8 blue-whale units, or 0.9 per cent of the allocated number. The fact that the Committee has succeeded in limiting the catch as close to the 16,000 blue-whale units agreed upon, must be attributed partly to good luck, and not alone to correct calculations. As the closing day of the baleen whale operations is to be given by at least 14 days' notice, the Committee must determine the date on the basis of the weekly reports available 3–4 weeks before the closing day. During this period the whaling results may vary considerably according to the weather conditions. It will appear from table *a* that the highest weekly number recorded was 1,580 blue-whale units. The calendar week December 24th–31st is not

included because a large number of humpbacks were killed during this period. The lowest weekly catch amounted to 769 blue-whale units.

The whaling period for baleen whales during the season 1949-50 lasted, as mentioned above, from December 22nd to March 15th or 84 days, which is 18 days less than for the season 1948-49 and 31 days less than for the season 1947-48. During the period 1934-35 until and including 1949-50—the war seasons excepted—the whaling seasons for the pelagic expeditions in the Antarctic have been as follows:—

Season 1934-35	December 1st-March 31st
1935-36	December 1st-March 15th
1936-37	December 8th-March 7th
1937-38	December 8th-March 15th
1938-39	December 8th-March 7th
1939-40	December 8th-March 7th
— — — —	
1945-46	November 24th-March 24th
1946-47	December 8th-April 7th
1947-48	December 8th-March 31st
1948-49	December 15th-March 26th
1949-50	December 22nd-March 15th

Table *b*, below, shows the average size of floating factories and catchers from 1933-34. It will be observed that the average size of the floating factories after the war has remained practically unchanged. On the other hand, the capacity of the catchers has increased, measured by

Table b.—Number and gross tonnage of floating factories and catchers engaged in pelagic whaling in the Antarctic 1933/34—1949/50.

¹⁾ Right-whales. ²⁾ 703 "Baleen-whales" no specification given, 2 right-whales.

average gross tonnage as well as by engine power. Whereas the floating factories during the seasons about 1936-37 employed catchers with an average capacity of about 280 gross tons and 1,000 I.H.P., the average size and engine power of the catchers in 1949-50 amounted to about 420 gross tons and 1,635 I.H.P. This considerable increase in tonnage and I.H.P. of the catchers obviously means a far more efficient whaling apparatus as compared with that of previous years.

In table c, above, is given a survey of the Antarctic whaling results from 1919-20 until and including 1949-50. It will appear from this table that last season's total catch amounted to 32,396 whales, which is an increase of about 960 whales as compared with the preceding season. The output of oil was 2,166,505 barrels, or 53,000 barrels less than in the season 1948-49. This considerable decrease in the oil production is due to the decrease in the sperm-oil production. Table c covers all whaling

¹⁾ For the seasons 1919/20-1930/31 the catch in the Ross Sea and from South Shetland and South Orkney is included in the figures for pelagic whaling in the Antarctic. ²⁾ Right-whales. ³⁾ 703 "Baleen whales" no specification given, 1 right-whale.

operations in the Antarctic, but as known, the whaling from the shore stations at South Georgia is quite insignificant in comparison with the pelagic operations.

A survey of the pelagic whaling in the Antarctic is recorded in table d, above. The pelagic operations in 1949-50 resulted in 29,017 whales killed, which is an increase of 523 whales as compared with the previous season. The blue-whale catch declined by 1,231 whales in 1949-50. It is well known that the presence of blue-whales is more plentiful during the first Antarctic summer months, and as the season 1949-50 opened a week later than in 1948-49 this may to a certain extent account for the decrease in the blue-whale catch. During the calendar week December 15th-22nd 1948 the pelagic expeditions killed 908 blue-whales, and deducting this number when comparing the blue-whale catch of the two last seasons, the actual decrease is 323 blue-whales.

In order to maintain the grand total of the catch, a continual decrease in respect to the blue-whale catch will lead to a comparatively higher taxation as far as the other species of whales are concerned. The catch of fin-whales, for instance, increased during the season 1949–50 by 860 animals, and the number of humpbacks killed amounted to 2,117 against 13 the previous season. The catch of sperm-whales, on the other hand, decreased by 1,295 animals. The large production of sperm-oil in the Antarctic during the later seasons and the activity of a floating factory having carried on sperm-whale operations off the coast of Peru in 1947 and 1948, resulted in an overproduction of sperm-oil and a very considerable drop in prices. This is undoubtedly the cause of the decrease in the sperm-whale catch during the season 1949–50.

Comparing the catch of blue- and fin-whales by the individual expeditions, quite considerable differences will be observed. One floating factory had for instance during the last season killed 1,259 blue-whales and 575 fin-whales, or 68.6 per cent of the former species and 31.4 per cent of the latter, while another floating factory had secured 33 blue-whales and 1,764 fin-whales, i.e. 1.8 per cent to 98.2 per cent. The catch of humpbacks also varied greatly in respect to the individual expeditions. Thus, during the 13 days the operations lasted, one floating factory accounted for 528 humpbacks while another killed 1 only.

The total pelagic oil production amounted to 2,019,368 barrels, consisting of 1,888,968 barrels of whale-oil (oil from baleen whales) and 130,400 barrels of sperm-oil. Compared with 1948–49 the production of whale-oil increased by 44,061 barrels. As only 11.1 more blue-whale units were utilized in 1949–50 than in the previous season the increased oil production is chiefly due to a higher output per blue-whale unit. The sperm-oil production in 1949–50 decreased by 72,160 barrels. This great decrease is due to the fact that the expeditions during the last season did not go in for sperm-whaling to the same extent as previously, owing to the considerable drop in the sperm-oil prices, and on the account of the large unsold stocks of sperm-oil.

Table e on page 16 gives i.a. the average daily oil production per floating factory (floating factory's daywork) as well as per catcher (catcher's day-work). The table includes the production of whale-oil only. The average daily production per floating factory during last season amounted to 1,267 barrels against 1,016 barrels in 1948–49. During the pre-war seasons the average daily production was about 900 barrels. The increase in the daily production per floating factory after the war is due to the fact that the floating factories now employ a greater number as well as more efficient catchers than before. During the seasons 1937/38-1939/40 each factory employed an average of 8 catchers, in 1948–49 about 11 and in 1949–50 about 12 catchers. The average daily production in 1949–50 was 106

Table e.—Average production per floating factory and catcher in the pelagic whaling in Antarctic 1925/26—1949/50 (exclusive of the war seasons).

¹⁾ Including the production from "Deception". ²⁾ Including the production of the aux. factory "Ole Wegger". ³⁾ Not including sperm-whales.

barrels per catcher, or an increase of 8 barrels compared with 1948–49. During the seasons 1932/33–1937/38 the average daily production per catcher varied from 129 to 159 barrels. This means that a pronounced decrease in the average daily yield per catcher has taken place, the increasing capacity of the catchers notwithstanding.

Table *f*, below, illustrates the relation between the various species of whales killed in pelagic operations for a series of years. During the seasons from 1927–28 until 1935–36 50–80 per cent of the total catch consisted of blue-whales, while the blue-whale catch during the last 3 seasons only amounted to 21–26 per cent of the total catch. This decline in the blue-whale catch is to a certain extent a consequence of the curtailment of the whaling period, by which during the last seasons whaling has not been carried on in the months when the presence of blue-whales is generally most plentiful in the Antarctic waters. The main cause is, however, that the stock of blue-whales is decimated. By comparing the catch of the various species of whales in each month during the last seasons with the corresponding figures for the seasons after 1931–32, it will be observed that the number of blue-whales killed also in January and February is lower now than usually before the war. In these two months whaling operations have, as generally known, been carried on at full capacity during all seasons.

In tables *g* and *h* on pages 18 and 19 is recorded the monthly catch in absolute and percentage figures since 1938–39.

Table *i* above gives the average size of whales killed from and including 1938–39. It will appear from this table that the average size of blue-whales was 79.03 feet in 1949–50 against 79.06 feet during the preceding season. The average size of blue-whales has increased slightly after the war as compared with the later pre-war seasons. This is probably due to the fact that the animals born immediately before and during the war were given the chance of developing, not being subject to disturbance by whaling operations until 1945–46.

The average size of fin-whales killed was 67.46 feet in 1949–50, i.e. a decrease of 0.47 feet when compared with the previous season. In spite of the period of preservation which also the fin-whale enjoyed during the war years, the increase in the average size is insignificant.

The average size of humpbacks was 40.63 feet in 1949–50. As known the taking of humpbacks in pelagic operations has been prohibited as from and including 1938–39. In 1937–38, the last season open to humpback catch, the average size was about 41.07 feet.

Since 1937–38 the minimum lengths, settled by international agreements, have been determined as follows:—

Blue-whales	70	feet
Fin-whales	55	»
Humpbacks	35	»

**Table j.—Average size of whales killed, by species and sex 1938/39—1949/50,
excl. of blue-whales less than 70', fin-whales less than 55' and humpbacks less than 35'.

Total animals.	39.98	—	42.45	—	—	—	—	—	46.00	42.58	41.01

Yet, in every season a certain number of whales under these lengths is being killed. As a variation in the number of these animals under the fixed minimum size is bound to influence the general average of all whales killed, we have in table *j* above recorded the average lengths of the various species, omitting all blue-whales under 70 feet, all fin-whales under 55 feet and all humpbacks under 35 feet.

In table *k* on page 22 is given a survey of mature and immature animals for a series of years.

The figures show that during the last season 22.94 per cent of the blue-whales killed were immature, while the corresponding pre-war percentage was about 30. The reduced percentage of immature animals is a consequence of the slight increase in the average size of the blue-whales killed. The percentage of immature fin-whales killed increased from 14.61 in 1948-49 to 17.93 in 1949-50. 39.19 per cent of the humpbacks killed were immature. The corresponding figure for 1937-38 was 36.6.

As published in earlier volumes of International Whaling Statistics the whaling grounds in the Antarctic have been divided into 5 areas as follows:—

Area I	between	60° west and 170° west
" II	"	0° " 60° west
" III	"	0° " 70° east
" IV	"	70° east " 130° east
" V	"	130° east " 170° west

As previously mentioned pelagic whaling is forbidden between 70° west and 160° west, which limits the pelagic operations in area I to 60° west—70° west and 160° west—170° west only. As it does not serve any purpose

¹⁾ Summary for 3 expeditions. ²⁾ 2 humbacks caught in the season 1939/40 are included.

to publish statistical details concerning the two above mentioned sections of 10° in Area I separately, the ground between 60° west and 70° west has now been included in Area II, while the ground between 160° west and 170° west has been included in Area V. The demarkations of the various areas have consequently been altered as follows:—

Area	I	between	70°	west	and	160°	west
"	II	"	0°	"	70°	west	
"	III	"	0°	"	70°	east	
"	IV	"	70°	east	"	130°	east
"	V	"	130°	east	"	160°	west

Table *l* on page 23 records the number and average size of whales killed in the above mentioned areas for a series of years. In the last season, 1949–50, the largest number of blue-whales was killed in Area V, viz. 2,631 animals or 42.96 per cent of the total blue-whale catch. In Area III 1,500 blue-whales were killed, or 24.49 per cent.

The largest fin-whale catch in 1949–50 took place in Area II, viz. 7,163 animals or 40.08 per cent of the total fin-whale catch. In Area III 5,100 fin-whales were killed or 28.53 per cent. The largest number of humpbacks was killed in Area V and that of sperm-whales in Area III.

Table *m* below gives a summary of the whaling results in the various areas for the period 1933/34–1949/50. Of a total catch of 132,592

Table m.—Number of whales killed during the seasons 1933/34—1949/50.

¹⁾ Barrel = 170 kg. (Barrel = abt. 1/6 long ton. 1 long ton = 1,016 kg.) ²⁾ Including the catch of two Norwegian expeditions hired by Germany—in 1936-37 1,756 whales, in 1937-38 2,158 whales, and in 1938-39 1,658 whales. ³⁾ Including the production of two Norwegian expeditions hired by Germany—in 1936-37 134,200 barrels, in 1937-38 180,750 barrels, and in 1938-39 118,380 barrels.

blue-whales during this period, 54,085 or 40.79 per cent have been killed in Area III. Of a total catch of 172,534 fin-whales, 68,257 or 39.56 per cent have been killed in Area II.

In table *n* on page 25 is given a survey of the pelagic whaling results of the various countries from and including 1936-37. As will be seen Norway and the British Commonwealth are predominating in respect to the number of whales killed and oil production as well as to the catchers employed.

South Georgia.

The whaling results of the shore stations operating from South Georgia are recorded in table *o* below.

In 1949-50 3 shore stations with a total of 21 catchers carried on whaling off South Georgia. The catch amounted to 3,379 whales, yielding an oil production of 139,229 barrels of whale-oil and 7,908 barrels of sperm-

¹⁾ Barrel = 170 kg. (Barrel = abt. 1½ long ton. 1 long ton = 1,016 kg.) ²⁾ Including the catch of two Norwegian expeditions hired by Germany—in 1936-37 1,756 whales, in 1937-38 2,158 whales, and in 1938-39 1,658 whales. ³⁾ Including the production of two Norwegian expeditions hired by Germany—in 1936-37 134,200 barrels, in 1937-38 180,750 barrels, and in 1938-39 118,380 barrels.

oil, i.e. a total of 147,137 barrels. The number of blue-whales decreased from 226 animals in 1948–49 to 14 in 1949–50. The fin-whale catch was practically unchanged as compared with the preceding season. On the other hand the number of sei-whales killed was more than doubled, from 562 animals in 1948–49 to 1,183 in 1949–50.

Tables *p* and *q*, on pages 27 and 28, give the catch off South Georgia by months in absolute and percentage figures from and including 1938–39, and table *r* on page 29 shows the proportion between mature and immature animals.

The total whaling results in the Antarctic during the seasons 1936–37 until and including 1949–50 are in table *s* on pages 30 and 31 distributed in respect to the various participating countries. From this table we learn that Norway's share of the total oil production in 1949–50 amounted to 51.1 per cent and that of the British Commonwealth to 30.6 per cent.

Table *t* below records the average output of oil per blue-whale unit for pelagic expeditions and for the shore stations at South Georgia.

For the pelagic expeditions the average yield of oil per blue-whale unit increased by 2.7 barrels as compared with 1948–49. For the shore stations, on the other hand, the average output per blue-whale unit decreased from 126.5 barrels in 1948–49 to 115.1 barrels in 1949–50.

Table *u* on page 33 is recording the average *weekly* production per blue-whale unit for the pelagic expeditions during the seasons 1948–49 and 1949–50.

It will be observed that the average yield per blue-whale unit is increasing as the whaling season proceeds, from 85–90 barrels in December to 140–150 barrels in March. It will also be observed that the average

production recorded for the last week of operation is disproportionately high as compared with that of the previous weeks. At the close of the season the expeditions are sounding their oil tanks for controlling purposes, and it then usually appears that the production exceeds the previously stated figures with some thousand barrels, and this "surplus" is then included in the production report of the last week of operation.

During the season 1949—50 10,726 men were employed in the Antarctic whaling industry. Of these 7,230 were Norwegians, 1,087 Japanese, 923 British, 677 Russians, 216 South-Africans, and 593 of other nationalities.

Total 959 blue-whale foetuses, of which 491 males and 465 females. Sex was not stated for 3 foetuses. Of the 956 foetuses for which sex was stated, 51.36 per cent were males and 48.64 per cent females. 4 foetuses were not found.

Fin-whale foetuses.
