PREFACE

The present publication, International Whaling Statistics No. XXVIII, embraces the results of the Antarctic whaling for the season 1950–51.

All the participating expeditions have sent in to the Committee for International Whaling Statistics the data prescribed in the International Convention for the Regulation of Whaling.

The Committee desires to draw attention to the fact that, during the preparation of the introductory tables to this publication, the following corrections concerning previous seasons have been made:—

Season 1923–24:—The floating factory “Thor I” which was operating off South Georgia is in previous publications recorded as a shore station. This has now been corrected.

During the *season 1928–29* the floating factory “Radioleine” operated off Kerguelen with 2 catchers. The result amounted to 113 blue-whales, 1 fin-whale, and 11 humpbacks, altogether 125 animals, from which 9,300 barrels of whale-oil were produced. These figures have now been included in the aggregate figures for pelagic whaling in the Antarctic.

During the *season 1929–30* the floating factory “Sevilla” killed 411 blue-whales, 75 fin-whales, and 1 humpback, totalling 487 animals. This result has not previously been recorded in International Whaling Statistics, but has now been included in the tables. Also 1 right-whale, killed from the shore station “Strømnes,” has been included.

Oslo, 1st April 1952.

Gunnar Jahn.

Birger Bergersen.

Einar Vangstein.

INTRODUCTION

During the Antarctic season 1950–51 19 floating factories and 3 shore stations carried on whaling with a total of 262 catchers, i.e. 1 floating factory and 25 catchers more than during the season 1949–50. The whaling material employed by the individual participating countries was as follows:—

Norway	10	floating factories,	1	shore station,	131	catchers

Total	19	floating factories,	3	shore stations,	262	catchers	

With the exception of Panama, all the other countries participating in the Antarctic whaling season 1950–51 have ratified the International Whaling Convention of 1946 and have also approved the alterations made in the Schedule of the Convention, adopted at the meetings of the International Whaling Commission.

The most important regulations of the International Whaling Convention concerning the pelagic whaling during the Antarctic season 1950–51 were:—

1. Catching period for baleen whales was from December 22nd 1950 to April 7th 1951. With regard to the closing day for baleen whale hunting, attention is drawn to paragraph 2.
2. Catch of baleen whales was not to exceed 16,000 blue-whale units. (As one blue-whale unit is reckoned 1 blue-whale or 2 fin-whales or $2\frac{1}{2}$ humpbacks or 6 sei-whales.) The Contracting Governments were to send in weekly reports of the catch converted into blue-whale units. On the basis of the reports received, the Bureau of International Whaling Statistics was to terminate the baleen whale operations by

- 14 days' notice if the permissible number of blue-whale units might be presumed to have been reached before April 7th 1951.
3. Pursuant to the Convention of 1946 the pelagic taking of humpbacks in the Antarctic had been prohibited. At the meeting of the Whaling Commission in London in 1949 it was decided that the pelagic expeditions could in each of the seasons 1949-50 and 1950-51 take 1,250 humpbacks. The expeditions were to send in weekly reports direct to the Bureau of International Whaling Statistics, which body, on the basis of the reports received, was to terminate the humpback whaling operations by giving at least 4 days' notice, when the permissible number of humpbacks might be presumed to be reached. At the meeting in Oslo in 1950 it was decided that the expeditions were to send in daily reports.
 4. It was forbidden to take

blue-whales	under 70 feet	
fin-whales	»	55
sei-whales	»	40
humpbacks	»	35
sperm-whales	»	35

Further, it was forbidden to take grey-whales or right-whales or female whales accompanied by a calf. The Convention also contained a provision enjoining full utilization of whales.

5. Pelagic whaling was prohibited between 70° West and 160° West.

The land stations on South Georgia were allowed a 6 months' consecutive catching period, and were otherwise subject to the same provisions as stated in paragraph 4 above.

At the meeting of the International Whaling Commission in 1949 it was provided that the pelagic expeditions in the Antarctic could kill 1,250 humpbacks in each of the seasons 1949-50 and 1950-51.

In the Schedule of the International Convention for the Regulation of Whaling, which, inter alia, deals with the taking of humpbacks, it is stated, according to the alterations adopted in 1950:—

“ 6. It is forbidden to use a factory ship or a whale catcher attached thereto for the purpose of taking or treating humpback-whales in any waters south of 40° South Latitude, provided that, in the pelagic whaling season 1950-51 a maximum of 1,250 humpback-whales may be taken in these waters commencing on February 1st.

8 (c) Notification shall be given in accordance with Article VII of the Convention, within two days after the end of each calendar week, of data on the number of blue-whale units taken in any waters south of 40° South Latitude by all whale catchers attached to factory ships under the jurisdiction of each Contracting Government, and in addition, notification

of data on the number of humpback-whales taken in pursuance of paragraph 6 shall be given at the end of each day.

8 (e) On the basis of data on number of humpback-whales taken in accordance with the provisions of paragraph 6 and reported in accordance with subparagraph 8 (c), the Commission, or such other body as the Commission may designate, shall determine the date on which the maximum catch of humpback-whales shall be deemed to have been reached and shall notify each factory ship and each Contracting Government four days in advance thereof. The taking of humpback-whales in all waters south of 40° South Latitude shall be illegal after midnight of the date so determined."

In Article VII of the Convention, to which reference is made in paragraph 8 (c) above, it is stated:—

"The Contracting Governments shall ensure prompt transmission to the International Bureau for Whaling Statistics at Sandefjord in Norway, or to such other body as the Commission may designate, of notifications and statistical and other information required by this Convention in such form and manner as may be prescribed by the Commission."

Under reference to Article VII it was resolved at the meeting of the Commission in London in 1949 as follows:—

"Resolution 6.

That in pursuance of Article VII of the 1946 Convention, the Commission will look to the Bureau of Whaling Statistics at Sandefjord,

- (a) to continue the reception of the statistical information on whaling operations
- (b) to continue to receive weekly blue-whale unit catch reports from Factory Ships operating south of 40° South Latitude and
- (c) to decide on the basis of the data received, the date when the blue-whale limit or any other quota will be reached

and to take appropriate action on the above, after consultation with the Chairman of the Commission."

Pursuant to the regulations adopted at the meeting of the Commission in Oslo in 1950 the pelagic expeditions were to transmit daily reports of the catch of humpbacks. These reports were in some cases received very late, due in some measure to the fact that certain expeditions, owing to atmospheric disturbances had difficulty in getting into touch with the coastal stations, while other expeditions omitted to send in reports if they had taken no humpback-whales. According to the telegraphic reports and the catch notices received, the taking of humpbacks commenced on February 1st. On February 2nd telegraphic reports had been received from 10 expeditions. It appeared from these that 3 expeditions had killed 150 humpbacks, while the other 7 expeditions had not taken any. The

Bureau of International Whaling Statistics was of the opinion that the reports which were to hand on February 2nd, covering the results of the first day's catch only, were inadequate to furnish a reliable basis for determining the length of the whaling period.

On February 3rd reports were to hand from 15 expeditions, and these had then taken 466 humpbacks on February 1st and 2nd. The Bureau therefore assumed that the average daily catch would be between 200 and 250 animals, and that 5 to 6 days would be needed for the taking of the maximum quota of 1,250 humpbacks. As the expeditions, however, were entitled to 4 days' notice, the earliest day for closing the operations could be February 7th midnight.

February 7th midnight was accordingly fixed as the closing date, and the Bureau sent out notification of this fact to the pelagic expeditions direct.

According to the telegraphic reports the catch of humpbacks amounted to:—

On	1st	February	272	humpbacks
2nd	»	253	»	
3rd	»	213	»	
4th	»	182	»	
5th	»	259	»	
6th	»	220	»	
7th	»	229	»	
<hr/>				
Total 1,628 humpbacks				

After examination of the statistical forms received at the return of the expeditions, it was found that the total number of humpbacks killed by the pelagic expeditions amounted to 1,630 animals, i.e. an excess of the fixed quota by 380 whales. Of this catch of humpback-whales 6 expeditions had accounted for 1,572 animals, while the other 13 expeditions had taken 58 animals only.

Pursuant to the regulations laid down in the International Convention 18 expeditions forwarded weekly reports of their catch converted into blue-whale units within 2 days after the expiration of each calendar week. The report from the 19th expedition was generally received by the statistical office 6 to 7 days after the expiration of the week.

Table *a*, page 11, gives a survey of the weekly catch of blue-whale units during the last 3 seasons in accordance with the telegraphic reports from the grounds. At a meeting of the Committee for International Whaling Statistics on February 20th 1951, reports per February 17th from all the expeditions, except one, were available. According to these reports the catch per February 17th 1951 amounted to 12,636 blue-whale units,

Table a.—Weekly catch of whales in blue-whale units.

12/2 " "	1,131.5	18/2 " "	1,267.1	17/2 " "	1,341.7
19/2 " "	1,215.5	25/2 " "	1,269.5	24/2 " "	1,568.5
26/2 " "	993.0	4/3 " "	1,208.5	3/3 " "	1,144.0
5/3 " "	1,130.5	11/3 " "	769.0	9/3 " "	991.4
12/3 " "	787.5	15/3 " "	690.6		
19/3 " "	809.5				
26/3 " "	658.5				
Total	15,926.0	Total	16,011.2	Total	16,371.3

including estimated figures from one expedition for the week February 11th—17th. On the basis of the whaling results per February 17th, with due consideration to the more changeable weather conditions towards the end of February and in March, and also with regard to the shorter working days at the end of the season, the Committee fixed March 9th midnight as the closing date. According to the telegraphic reports from the grounds, the aggregate result then amounted to 16,371.3 blue-whale units.

By examining the statistical data provided by the companies at the close of the season, it appears that the total catch of the pelagic expeditions amounted to:—

6,966 blue-whales	=	6,966.0 blue-whale units
17,474 fin-whales	=	8,737.0 →—
1,630 humpbacks	=	652.0 →—
367 sei-whales	=	61.2 →—
Total 26,437 whales	=	16,416.2 blue-whale units

The discrepancy between the telegraphic reports and the above aggregate figures extracted from the statistical forms is due to the fact that some of the expeditions do not include in their weekly reports flagged whales lost, or whales lost by the floating factories. During the last season an excess of 416.2 blue-whale units appeared, owing to more favourable results after February 17th 1951 than anticipated by the Committee.

Table b.—Number and gross tonnage of floating factories and catchers engaged in pelagic whaling in the Antarctic 1933/34—1950/51.

1950-51....	19	271,646	14,297	241	109,101	453	1,825	

Order to cease operations prior to the official closing day has now been given for 4 seasons in succession. During these seasons the total catch has amounted to:—

Season 1947-48	16,364.3 blue-whale units
1948-49	16,007.4 —,—
1949-50	16,062.1 —,—
1950-51	16,416.2 —,—

The total excess of the maximum quota amounted in all, during these 4 seasons, to 850.0 blue-whale units, or about 1.3 per cent of the catch.

The whaling period for baleen whales during the pelagic season 1950-51 lasted from December 22nd to March 9th, or 78 days, which is 6 days less than the whaling period of the preceding season and 24 days less than that of the season 1948-49. During the post-war years the length of the whaling seasons for the pelagic expeditions has been as follows:—

	Catching days
Season 1945-46	November 24th-March 24th 121
1946-47	December 8th-April 7th 121
1947-48	December 8th-March 31st 115
1948-49	December 15th-March 26th 102
1949-50	December 22nd-March 15th 84
1950-51	December 22nd-March 9th 78

In table b, above, is recorded the number, total gross tonnage and average size of floating factories and catchers from 1933-34. The average

size of the floating factories after the war has increased only slightly compared to that of pre-war years. On the other hand the capacity of the catchers, measured by average gross tonnage as well as by engine power, shows a considerable increase. During the season 1935-36 the average size of the catchers was 257 gross tons and the average engine power 907 I.H.P. During the season 1950-51 the average capacity of the catchers was 453 gross tons and 1,825 I.H.P., or twice the engine power.

Table c, above, gives a survey of the Antarctic whaling results from 1919-20 until and including 1950-51. It will appear from this table that the operations of the last season resulted in 33,997 whales, yielding 2,303,690 barrels of whale- and sperm-oil. As commonly known the whaling from the shore stations on South Georgia is quite insignificant in comparison with the pelagic operations, and the pelagic whaling results have therefore been recorded separately in table d, page 14.

Table d.—Pelagic whaling in the Antarctic.¹

¹⁾ For the seasons 1919/20–1930/31 the catch in the Ross Sea and from South Shetland and South Orkney is included in the figures for pelagic whaling in the Antarctic. ²⁾ Right-whales. ³⁾ 703 "Baleen whales" no specification given, 1 right-whale. ⁴⁾ Bottlenose.

From table d it will appear that the pelagic expeditions during the season 1950–51 killed 31,180 whales from which were produced 2,152,498 barrels of whale- and sperm-oil. The blue-whale catch amounted to 6,966 animals, which means an increase of 798 blue-whales compared with the previous season. The fin-whale catch declined by 587 whales and the humpback catch by 487 whales. On the other hand, the number of sperm-whales killed increased considerably, viz. from 2,570 in 1949–50 to 4,742 in 1950–51. This increase is accounted for by the firm sperm-oil market in the autumn 1950, which led to several pelagic expeditions proceeding to the grounds at an earlier date. The number of sperm-whales killed —4,742—is the largest number of sperm-whales ever killed during one single season. In 1948–49 3,865 sperm-whales were killed, while the highest pre-war figure was 2,468 sperm-whales in 1938–39.

Table e.—Average production per floating factory and catcher in the pelagic whaling in Antarctic 1927/28—1950/51 (exclusive of the war seasons).

The total pelagic oil production consisted of 1,909,640 barrels of whale-oil and 242,858 barrels of sperm-oil. The output of the previous season 1949-50 amounted to 1,888,968 barrels of whale-oil and 130,400 barrels of sperm-oil. That means an increase in 1950-51 of 20,672 barrels of whale-oil and 112,458 barrels of sperm-oil. As in 1950-51 356.3 more blue-whale units were utilized than in the previous season, the increase in the whale-oil production of only 20,672 barrels is chiefly due to a lower output per blue-whale unit (see table *t*, page 32).

Table *e*, page 15, gives a survey for a series of years of the average total and average daily oil production per floating factory as well as per catcher. The table includes the production of whale-oil only. When judging the whaling results on the basis of these figures due consideration must be taken to the limitation of the catch through curtailments of the whaling period and fixation of maximum quotas. Moreover, attention must be drawn to the variation in the number of floating factories and catchers employed, and to the considerable increase of the capacity of the whaling material in the post-war years.

Table *f*, above, illustrates the relation between the various species of whales killed in pelagic operations in the Antarctic as from the season 1927-28. In the season 1950-51 22.3 per cent of all whales killed were blue-whales. Although this is an increase of 1 per cent compared with the previous season, the blue-whale catch during the last 4 seasons—amount-

ing to 21–26 per cent only—is considerably lower than during the seasons previous to 1947–48. During the seasons around 1930 70–80 per cent of the total catch consisted of blue-whales, and during the latest pre-war seasons 30–40 per cent. This decline in the blue-whale catch is to a certain extent a consequence of the curtailment of the whaling period during the last pre-war and the post-war seasons. As known, the presence of blue-whales is generally most plentiful during the Antarctic spring-months. In the seasons around 1930 whaling commenced already in October, while the whaling period in the last seasons has commenced on December 22nd.

However, the main cause of the constantly decreasing blue-whale catch seems to be the decimation of the stock of blue-whales. By comparing the catch of the various species of whales in each month during the last seasons with the corresponding figures for the seasons after 1931–32, it will appear that the number of blue-whales killed also in January and February is lower now than usually in the thirties. In these two months whaling operations have, as generally known, been carried on at full capacity during all seasons. The monthly catch is recorded in absolute and percentage figures as from the season 1938–39 in tables *g* and *h*, pages 17 and 18.

Table *i*, above, records the average size of whales killed from and including 1938–39. It will appear from this table that the average size of blue-whales killed in the pelagic whaling in 1950–51 was:—

**Table j.—Average size of whales killed, by species and sex 1938/39—1950/51,
excl. of blue-whales less than 70', fin-whales less than 55' and humpbacks less than 35'.

Total animals .	39.98	—	42.45	—	—	—	—	46.00	42.58	41.01	41.10

Males 77.31 feet
 Females 79.43 ,,,
 All blue-whales 78.28 ,,,

Compared with the previous season this is a decrease of

0.39 feet for males
 1.28 ,,, females
 0.75 ,,, all blue-whales.

From and including the season 1945–46 there has been a steady increase from season to season in the average size of blue-whales killed. The reason for that is probably that the animals born immediately before and during the war, enjoyed a period of preservation due to the war-time interval in the whaling activities. Yet it is too early to give an opinion whether the great decrease in the average size during the last season means that these age-groups have already been depleted. The decrease may, however, indicate that many young animals have been killed this last season.

The average size of fin-whales killed in 1950–51 was:—

Males 65.28 feet
 Females 68.24 ,,,
 All fin-whales 66.71 ,,,

which is a decrease, as compared with the previous season, of

0.70 feet for males
 0.83 ,,, females
 0.75 ,,, all fin-whales.

The average size of fin-whales killed also increased during the first post-war seasons. In 1947–48 the average size reached 67.94 feet, the

highest figure recorded since 1934–35. In 1949–50, however, the average size decreased by 0.47 feet and in 1950–51 by further 0.75 feet. During the last two seasons the average size of fin-whales has decreased by 1.22 feet, and this seems to indicate that also the fin-whale catch during these seasons has consisted of a larger number of young animals compared to previous seasons.

The average size of humpbacks killed was 40.79 feet in 1950–51 against 40.63 feet in 1949–50. As known, the taking of humpbacks in pelagic whaling has been prohibited as from and including 1938–39. In 1937–38, the last season open to humpback catch, the average size was about 41.07 feet.

In table *j*, page 20, is recorded the average size of the whales killed being above the present minimum lengths, settled by international agreements. These minimum lengths are:—

70 feet for blue-whales

55 „ „ fin-whales

35 „ „ humpbacks.

Table *j* has been worked out in order to eliminate the possible influence a variation in the number of undersized whales killed might have on the average size.

Table *k*, page 21, gives particulars of the catch of mature and immature animals.

¹⁾ Right-whale.

According to Mackintosh and Wheeler the blue-whale and fin-whale generally reach sexual maturity at the following lengths:—

Blue-whales:	Female	77'9"
	Male	74'2"
Fin-whales:	Female	65'7"
	Male	63'8"

According to Harrison and Matthews the humpback generally reaches sexual maturity at a length of 12.5 meters for female and 12 meters for male animals. Converted into English measure this means:—

Humpbacks:	Female	41'0"
	Male	39'4"

females	464	66.76	217	61.65	163	64.17	327	64.50	493	76.43	832	85.6	708	67.88	645	69.96	681	66.12	773	68.41
animals	888	67.94	520	67.01	365	67.22	674	68.29	1,137	78.09	1,391	83.3	1,507	70.35	1,331	69.25	1,275	64.49	1,366	68.92

The calculations of the proportion of mature and immature whales are thus based on the average size of the whales killed. Regarded as mature animals are:—

Blue-whales:	Female ..	77 feet and above		
	Male	74	—,—	
Fin-whales:	Female ..	65	—,—	
	Male	63	—,—	
Humpbacks:	Female ..	41	—,—	
	Male	40	—,—	

It will appear from table *k* that 29.39 per cent of the blue-whales killed in 1950–51 were immature. This is an increase in the number of immature blue-whales killed of 6.45 per cent compared with the season 1949–50. The same trend is stated for the fin-whales. The percentage of immature fin-whales has increased from 14.61 in 1948–49 and 17.93 in 1949–50 to 23.89 in 1950–51.

The whaling ground in the Antarctic, operated by the pelagic expeditions, extends from 70° west and eastwards to 160° west. The ground covers an area of about 8,100 miles, if the 60° latitude is considered as the basic line. It is evident that the whaling conditions and the presence of whales cannot be equal within this huge area.

For the purpose of obtaining more detailed information on the pelagic activities in the Antarctic the area around the South Pole cap has been divided into the following areas:—

Area I	between	60° west	and	170° west
„ II	„	0°	„	60° west
„ III	„	0°	„	70° east
„ IV	„	70° east	„	130° east
Area V	„	130° east	„	170° west

As previously mentioned pelagic whaling is forbidden between 70° west and 160° west, which limits the pelagic operations in Area I to 60° west–70° west and 160° west–170° west. As it does not serve any purpose to publish statistical details concerning the two above mentioned sections of 10° in Area I separately, the ground between 60° and 70° west has now been included in Area II, while the ground between 160° west and 170° west has been included in Area V. The demarcations of the various areas have consequently been altered as follows:—

Area I	between	70° west	and	160° west
„ II	„	0°	„	70° west
„ III	„	0°	„	70° east
„ IV	„	70° east	„	130° east
Area V	„	130° east	„	160° west

Table *l*, page 22, gives a survey of the number and average size of blue-, fin- and humpback-whales killed in the above mentioned areas for

¹⁾ Other whales are reduced to blue-whale equivalents on the following basis: — 1 blue-whale = 2 fin-whales = $2\frac{1}{2}$ humpbacks = 6 sei-whales. ²⁾ Barrel = 170 kg. (Barrel = abt. $\frac{1}{6}$ long ton. 1 long ton = 1,016 kg.)

a series of years. As in the preceding season 1949–50, the largest number of blue-whales was also in 1950–51 killed in Area V, viz. 2,866 animals or 41.37 per cent of the total blue-whale catch. The remaining 59 per cent are divided rather equally on the other 3 areas.

In 1950–51 32.13 per cent of the fin-whales were killed in Area II, while the remaining 68 per cent are divided on the other areas in the proportion of 24—24—20 per cent. 1,112 humpbacks, or 68.47 per cent of the total catch, were killed in Area IV. Only 1 per cent of the humpbacks were killed in Area III, while the other humpbacks are divided on Areas II and V.

Table *m*, page 23, contains a summary of the whaling results by species in each area during the period 1933/34–1950/51. It will appear from this table that 39.79 per cent of the total blue-whale catch during these years have been killed in Area III. The largest number of fin-whales has been taken in Area II, viz. 73,815 animals, or 38.89 per cent of the total fin-whale catch. 45.87 per cent of the humpbacks have been taken in Area IV, while 42.07 per cent of the sperm-whales have been killed in Area III.

A comparison of the aggregate whaling results in the different areas during the above mentioned period 1933/34–1950/51 with the corresponding figures for the season 1950–51 reveals that during the said period 44.66 per cent of all whales killed in Area IV were blue-whales. In the last season a total of 7,683 whales were killed in Area IV, of which 1,076 or 14 per cent are blue-whales.

Table *n*, page 24, records the pelagic whaling results of the individual participating countries during the period 1937/38–1950/51.

South Georgia.

The whaling results of the shore stations operating from South Georgia are given in table o, page 25.

In 1950–51 3 shore stations with a total of 21 catchers carried on whaling off South Georgia. The catch amounted to 2,817 whales, yielding an oil production of 141,248 barrels of whale-oil and 9,944 barrels of sperm-oil. That means an increase of 4,055 barrels of whale- and sperm-oil compared with the preceding season. 82 blue-whales were killed against 14 blue-whales in 1949–50. The fin-whale catch, on the other hand, decreased by 17 animals, and the number of sei-whales killed decreased by 664 animals compared to the previous season. The sperm-whale catch amounted to 226, the highest number of sperm-whales killed ever recorded from South Georgia.

Table p and q, pages 26 and 27, give the catch off South Georgia by months in absolute and percentage figures from and including 1938–39, and table r, page 28, shows the proportion of mature and immature whales killed.

The total whaling results in the Antarctic in the seasons 1937–38 until and including 1950–51 have in table s, pages 30 and 31, been distributed

	100.0	per cent

Table *t*, page 32, records the average output of oil per blue-whale unit for South Georgia and for the pelagic expeditions from 1924–25. For the shore stations on South Georgia the average yield of oil per blue-whale unit increased from 115.1 in 1949–50 to 121.5 barrels in 1950–51. For the pelagic expeditions, on the other hand, the average output has decreased from 118.6 barrels in 1949–50 to 117.3 barrels in 1950–51.

Table *u*, page 33, is recording the average *weekly* production per blue-whale unit for the pelagic expeditions during the last two seasons.

It will appear that the average yield per blue-whale unit is increasing as the whaling season proceeds, from 70–90 barrels in December to 140–150 barrels at the beginning of March. At the close of the season the floating factories are sounding their oil tanks for controlling purposes, and an eventual "surplus" will then be included in the production report of the last week of operation. For that reason the average production recorded for the last week of operation will generally be disproportionately high as compared with that of the previous weeks. In 1950–51 the closing day for baleen whale hunting was March 9th against March 15th in 1949–50, and consequently the expeditions secured less of the fat animals available at the close of the season. This must to some extent account for the decreased output per blue-whale unit in 1950–51. Another contributory cause may be found in the fact that the average size of both blue- and fin-whales was rather smaller during the last season.

In table *v*, page 34, detailed information is, for the first time, given on the production of *by-products* in the Antarctic whaling. These data cover the post-war years 1945/46–1950/51.

During the season 1950–51 11,670 men were employed in the Antarctic whaling industry. Of these 7,489 were Norwegians, 1,130 Japanese, 1,016 British, 700 Russians, 504 Germans, 196 South Africans, and 635 of other nationalities.

Total 979 blue-whale foetuses, of which 462 males and 516 females. Sex was not stated for 1 foetus. Of the 973 foetuses for which sex was stated, 47.24 per cent were males and 52.76 per cent females. For 1 female foetus the length was not stated.

Fin-whale foetuses.
