Appendix. The NUTS-3 classification of municipalities	52

1. INTRODUCTION

In April 1993, Statistics Norway was asked by Eurostat (Statistical Office of the European Communities) to provide a set of regional statistics in the context of the accession negotiations for Norway. The requested data comprised gross value added statistics, agricultural accounts statistics, employment and unemployment statistics, and population and area statistics. All the requested data were transmitted to Eurostat by the end of August 1993. Based on this information Eurostat produced the dossier "Regional indicators - Norway", which contains indicators prepared according to EC methodology and compared to EC averages.

This paper contains the data which were compiled by Statistics Norway, with short descriptions of sources and methods of estimation used in compiling regional value added (chapter 3), agricultural accounts (chapter 4), annual work units in agriculture and forestry (chapter 5) and employment (chapter 6). Chapter 2 contains a brief description of the Norwegian NUTS regional classification system underlying the data compilations. The regional value added estimation is based on data from a project originally carried out by Torill Naustvoll and reported in Notater 93/8 from Statistics Norway. Torill Naustvoll has also contributed to the documentation in chapter 3. The compilations which apply to agricultural accounts and annual work units in agriculture and forestry have been carried out in collaboration with the Budgeting Committee for Agriculture in Norway.

Sverre Nordseth has been responsible for the computer programs used in the data compilations.

The concepts and definitions used are in agreement with the Norwegian national accounts, while the precise definitions are given in the national accounts publications. The concept "annual work units" in agriculture and forestry is, however, not used in Norwegian statistics.

The data on employment and unemployment characteristics requested by Eurostat are not reported here.

2. THE NUTS CLASSIFICATION OF NORWAY

The term NUTS means "Nomenclature of Territorial Statistical Units". This classification is a regional classification originally defined for the members of the European Community. The NUTS regions are used as statistical units to produce regional indicators on a number of different topics in the European Community. The regional differences in various indicators are then used as background information in the implementation of the EC regional policy, and also to guide the surveillance of regional policies of the Member States. The Norwegian application for membership - both in the EEA and the EC - made it necessary to construct a corresponding regional classification system for Norway. The Norwegian NUTS classification has been determined by the Ministry of Local Government and Labour.

The NUTS classification has three levels, NUTS-1, NUTS-2 and, as the most detailed level, NUTS-3.

NUTS-1 regions

The NUTS-1 level is identical to the standard classification of aggregated regions used by Statistics Norway (landsdel). There are five such regions, defined by aggregation of counties according to table 1.

Table 1. Definition of NUTS-1 regions

NUTS-1 region	Region name	Member counties
1	Østlandet	Østfold, Akershus, Oslo, Hedmark, Oppland, Buskerud, Vestfold, Telemark
2	Agder/Rogaland	Aust-Agder, Vest-Agder, Rogaland
3	Vestlandet	Hordaland, Sogn og Fjordane, Møre og Romsdal
4	Trøndelag	Sør-Trøndelag, Nord-Trøndelag
5	Nord-Norge	Nordland, Troms, Finnmark

NUTS-2 regions

The NUTS-2 regions are identical to the Norwegian counties. Consequently, there are 19 such units.

NUTS-3 regions

The NUTS-3 regions consist of groups of municipalities which are contiguous and do not cross county borders. There are 49 NUTS-3 regions. The definitions of the NUTS-3 regions can be seen from table 2, also giving some key statistics on the NUTS-3 and NUTS-2 regions. We also present a map showing the borders of the NUTS-3 regions. A list of the municipalities belonging to each of the NUTS-3 regions is found in the appendix.

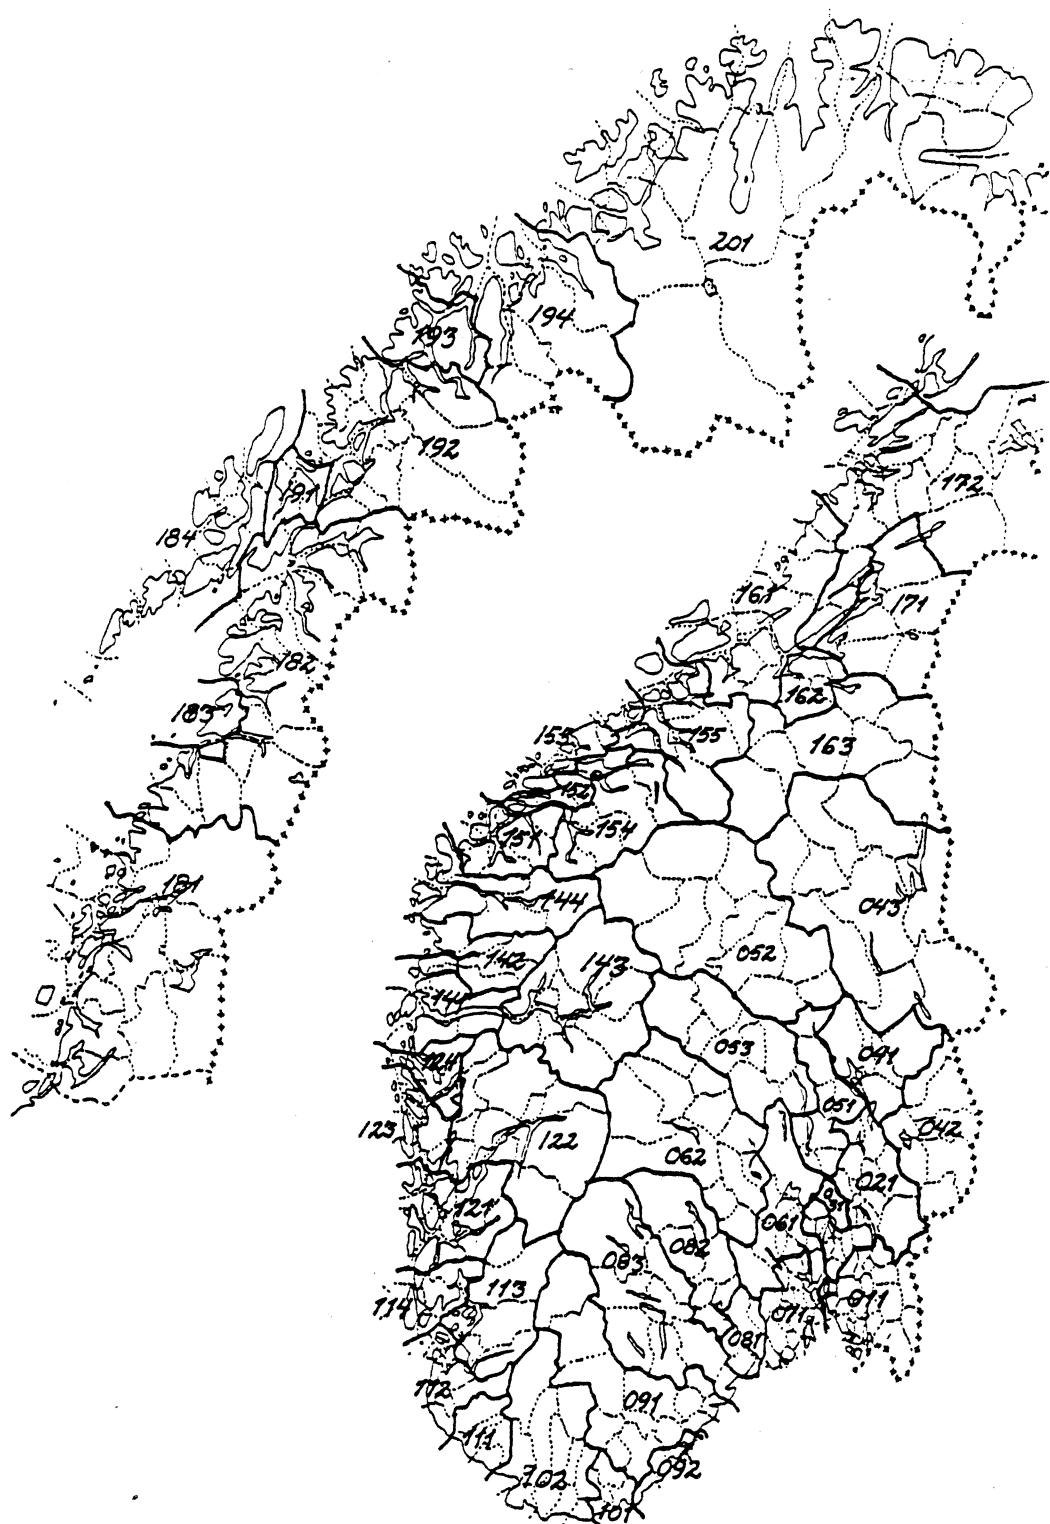

Table 2. Key statistics on Norwegian NUTS-2 and NUTS-3 regions. Mean population, land area, population density and population growth 1980-1990.

NUTS-2 (County)/ NUTS-3 region	Mean population 1990	Land area km2	Population density 1990	Annual popu- lation growth 1980-1990 Per cent

Figure 1. The NUTS-3 regions

3. REGIONAL VALUE ADDED COMPILATION 1986-1990

3.1. Introduction

Statistics Norway compiled the first set of regional accounts for the year 1965 (published in 1970). Since then, regional accounts have been constructed with 3 - 4 years intervals. The regional units have been the 19 Norwegian counties. The latest complete regional accounts apply to the year 1986. The accounting work has been performed within the national accounts division. The conceptual and definitional structure of the national accounts has been the framework also for the regional accounts. The Norwegian national accounting system is based on recommendations given by the UN (SNA), and the industrial classification corresponds to the International Standard Industrial Classification of all Economic Activities (ISIC).

The regional accounts have been designed as a breakdown of input-output figures from the national accounts. Regional output and input figures have been calculated in a rather disaggregated manner, specifying about 180 branches (industries) and 300 commodities. Gross output, intermediate consumption and value added are allocated to counties according to the location of the producing units. Components of value added, household and government consumption and gross fixed capital formation have also been allocated to regions. Exports and imports have, however, not been regionalized.

Data from the regional accounts have been used for various planning and research purposes. These data have enabled construction of different types of economic forecasting models.

In 1992 Statistics Norway started a project with the aim to allocate gross value added (gross domestic product) for the year 1990 to the Norwegian NUTS-3 regions. These calculations were based on somewhat simplified methods compared to the complete regional accounts compilation, and preliminary figures were available in March 1993. The work was carried out by a request from the Norwegian Ministry of Local Government and Labour. The Ministry also decided the NUTS-3 delimitation containing 49 regions. The focus was on the total value added per capita in the regions and not on the industrial breakdown. These estimates have been further improved and revised during 1993.

3.2. Principles for the 1990 regionalization of GVA

The methodological approach has been to allocate national accounts figures of gross value added (GVA) to regions by using distributional keys corresponding to each industry in the national accounts system. The keys are constructed on the basis of indicators which reflect as closely as possible the feature to be estimated. The distributional keys are based on statistics related to establishments (local kind of activity units). The guiding allocation principle has been "*resident producer units*". The statistical sources are outlined in chapter 3.3 below.

The allocation principle of resident producer units also applies to establishments belonging to an enterprise located in a central region. In a few business services and transport industries, some of the operations can be considered as exports of services to other regions. The value added is thus located analogous to the treatment of exports of services between countries. Hence, the value added produced by a business consultant, for instance, is located to the region of the establishment that he represents, even though the service may have been executed in another region.

The first step of the breakdown procedure was to allocate GVA within each industry to a local level, i.e. the municipal level. Secondly, these local value added figures were aggregated to total NUTS-3 figures, by adding across industries and municipalities within each region.

As far as we can see there are no major inconsistencies between our regional methodological approach and the EC approach (referring to Document E/reg/54 from Eurostat). Some industries, like credit services, are however not treated according to EC recommendations. Besides, our national accounting system is based on SNA and not on ESA.

Ancillary activities are allocated to the same industry as the enterprise's main activities and to the region where they are actually situated. Value added in such activities comprise only wages and salaries. Building sites are normally not considered to be independent units.

Only value added figures at market prices have been allocated to regions. We have made no attempt to regionalize taxes and subsidies linked to production, and consequently GVA at factor cost is not estimated. This is according to the initial project specification from the Ministry.

Gross value added in *oil activities* on the Norwegian continental shelf is allocated to the extra-regio. This includes crude petroleum and natural gas production and pipeline transport. About 95 per cent of the total GVA in this industry is allocated to the continental shelf. About 5 per cent of the GVA is allocated to NUTS-3 regions according to the location of the ancillary units in this industry. GVA in ancillary units comprise compensation of employees in administrative offices and supply bases. Value added in Norwegian oil drilling activities (on or outside the continental shelf) is fully allocated to NUTS-3 regions.

Additionally, we have attempted to allocate total value added in crude petroleum and natural gas production and pipeline transport to NUTS-3 regions by a simplified *ad hoc* procedure, based on the site of the location of the onshore ancillary units. The allocation method combines regional statistics providing information on the onshore establishments in this industry and income statistics about their respective enterprises. Due to the size of the oil industry in the Norwegian economy and the concentration of the ancillary activities to certain regions, these assumptions had a major influence on the regional value added totals.

The islands Svalbard and Jan Mayen and embassies abroad are also parts of the Norwegian territory, but do not belong to municipalities within the NUTS-3 classifications. The value added generated at these sites is rather insignificant, amounting to about 0,05 per cent of GDP, and is allocated to the extra-regio.

3.3. Statistical sources in the 1990 regionalization of GVA

The methods applied to break down gross value added to the municipal level vary across industries. The crucial step is to find adequate statistics explaining the local distribution of value added of each industry. The available sources for calculating the regional distribution of GVA are quite reliable in some industries and more imperfect in others.

Agriculture, forestry and fishing

In these industries, except the breeding of fish, data on *pensionable income of self-employed persons* is used to regionalize value added. The income data are available from the register of the taxation authorities. As to the breeding of fish, the distributional key is based on the number of man-hours applied in each municipality available from official statistics for this industry.

Manufacturing industries, mining, quarrying and oil extraction

In Norway, statistical sources about the manufacturing industries are generally more developed than statistics covering the service industries. Establishment figures of gross output and intermediate consumption of each manufacturing industry are available at a municipal level. Hence, estimates of local values added in manufacturing industries (including mining and quarrying) are readily available. As emphasized above only ancillary activities in oil extraction are allocated to municipalities.

Wholesale and retail trade, building and construction etc.

Total sales is the distributional key used for wholesale and retail trade, building and construction, oil drilling and some minor transport services. Total sales is equivalent to gross output, except for the fact that the latter also includes increase in stocks. As long as neither the proportion of intermediate input to total sales value nor increase in stocks differ much across regions, total sales value provide an appropriate proxy for the distribution of value added.

Figures of total sales are available from the Norwegian Central Register of Establishments and Enterprises. With the exception of building and construction, this register provides statistics relating to local kind of activity unit. As to building and construction, only major building sites of some considerable permanence are recorded as units. However, both onshore administration offices in oil drilling and local offices belonging to national-wide construction enterprises are recorded as units.

Local and central government administration and private services

As there are no market values on services produced by the central and local government, and the operating surplus is zero by definition, value added comprises compensation of employees and consumption of capital. The latter does not account for more than 6% of total value added in these industries in 1990. Thus, *compensation of employees* is considered to be an adequate indicator and distributional key in these industries. In local government, information on compensation of employees is available from the Municipal Accounts, but not as regards the county and central government services.

In central government services, except defence and a few minor central government activities, the indicator and distributional key is the municipal distribution of *number of employees* (at the place of work) which stem from the Central Register of Civil Servants. The number of employees also applies to the county government services, to break down the county value added to the municipal level. Information about local employment is available from various statistics on each of these services, whereas value added generated in each county stems from the Municipal Accounts.

GVA in the *defence industry* is allocated to municipal level according to unofficial figures of the location of *number of employees*. These figures from the Ministry of Defence also include the number of soldiers.

Furthermore, compensation of employees is used as the distributional indicator in industries like financial services, hotels and restaurants, transport services and electricity supply. This means that gross operating surplus in these industries is allocated proportional to compensation of employees which is a questionable assumption. Imputed output of bank services is then allocated according to the compensation of employees in credit services.

The *number of employees* is basically a less satisfactory regional indicator than *compensation of employees*, since compensation per employee may differ systematically across regions in some industries. In local and central government services the payment of the same position is about the same level, but most well-paid positions within the central government tend to be located in central regions.

Ocean transport

As value added in ocean transport is mostly generated outside the Norwegian territory, the problem of allocating GVA is similar to those of the oil activities on the continental shelf. The regional allocation is based on the residence of the establishments, and the distributional key is the number of employees. This is considered to be a rather weak allocating method, because differences in freight rates, types of cargos etc., probably contribute a lot more to the variations in GVA in various regions than the number of employees.

VAT and import taxes

Value added tax (VAT), taxes on investment expenditures, custom duty and other taxes on imported products are not allocated to industries, but treated as correction items in the national gross value added estimates. As directly imported products provide no link to production within the NUTS-3 regions, all import taxes are allocated to regions proportional to the total GVA.

The VAT related to domestic production is allocated to the NUTS-3 regions by a two-step procedure. First, the figures are allocated to various industries in accordance with each industry's share of the value added generated in basic prices. This allocation is based on a disaggregated table of the national accounts. Secondly, each industry's share of VAT is allocated to the regional level by the GVA distributional key corresponding to each industry. The allocation of the investment expenditure tax is treated in the same way as VAT, bearing in mind that just a few industries are liable to this tax.

3.4. Regionalization of GVA for the years 1986-1989

Due to limited time resources we have used a somewhat different methodological approach for these years compared to the 1990 compilation. The first step was to estimate value added figures for counties (NUTS-2 regions) consistent with the national accounts figures. The second step was to break down GVA from NUTS-2 to NUTS-3 regions. These calculations were made at a more aggregated industry level (42 industries) than used in the 1990 compilation. The regional distribution of the NUTS-2 figures to NUTS-3 level assumes the same distributional structure within each industry in the years 1986-1989 as in 1990, and consequently, these estimates are less accurate.

For the year 1986 we could use a complete set of regional accounts already available on NUTS-2 level. Some minor reallocation of activities originally allocated to the extra-regio was, however, required to match the principles used in the 1990 calculations. This was the case for ocean transport, oil drilling, air transport and the defence industry. These industries are distributed according to the 1990 figures for all years 1986-1989. GVA in these industries amounted to 4.5 per cent of total GVA in 1989.

For the period 1987-1989, GVA NUTS-2 figures are constructed as for 1986 (and in most cases also consistent with the 1990 compilation) for those industries where regional statistics are most readily available. This covers mining and manufacture, local government administration,

business services, production of electricity, production of oil and gas, hotel and restaurant services etc. GVA in these activities covers 49.7 per cent of total GVA (1989). For several industries we have, however, estimated NUTS-2 figures as a moving average of the corresponding regional distributions for 1986 and 1990. This applies to agriculture, forestry and fishing, building and construction, central government, and most of communication and personal services. GVA in these industries amounts to 35.7 per cent of total GVA (in 1989).

For the years 1986-1989, the same part of VAT and investment expenditure tax was supposed to be related to imports as for 1990. The remaining part of these taxes was distributed by proportionally adjusting the percentage of these taxes in relation to total GVA of each county in 1990 to yearly totals.

Among the changes in methods and sources between the calculations for 1986 and 1990, the most important ones relate to agriculture, forestry and fishing and to the construction industry. In 1986, agriculture, forestry and fishing were regionalized according to detailed calculations for a large number of relevant products. Later, we have constructed 1989 accounts in this way for agriculture and forestry (see chapter 4). These calculations were, however, not yet available when the 1990 GVA figures were estimated. The building and construction industry was in the 1986 accounts located according to the regional distribution of relevant investments.

3.5. Results

The results of the regional value added compilations for the years 1986-1990 are presented in tables 3-12. In tables 8-12 we have calculated GVA per capita for the NUTS-2 and NUTS-3 regions and an index showing the relative values. In constructing this index we have allocated the GVA corresponding to undistributed extra-regio activities to all regions in proportion to their total GVA.

4. AGRICULTURAL ACCOUNTS 1989

4.1. Definition of the agricultural sector

In the Norwegian national accounts the contents of the agricultural sector are given by the following industry breakdown:

Agriculture, production of crops, which comprises the cultivation of all types of agricultural and horticultural crops such as hay and other animal feed, grains, potatoes, vegetables, fruit, berries, flowers and plants.

Agriculture, livestock production, which comprises the raising of domestic animals with or without affiliation to farm operations, such as the breeding of cattle, sheep and goats, pigs, poultry, bees, reindeer, fur-bearing animals and horses.

Own account capital formation in agriculture, income from transport etc comprises the work carried out by the agricultural sector's own production factors in connection with investment and transport.

Agricultural services which include milk-recording and testing and insemination.

Hunting and game propagation which comprises the hunting and catch of birds and land animals as an economic activity.

Forestry includes all work on felling and hauling of timber (including timber floating and lorry transport paid by the forest owner). It is assumed that a certain share of silviculture and construction of roads carried out by the forestry's own production factors are included under forestry in the national accounts. In addition, incomes and costs in connection with the collection of wild berries and plants are included under forestry in the Norwegian national accounts.

4.2. Sources and methods of estimation of the agricultural sector

The calculations of the items in the production accounts of agriculture (except for forestry and hunting and trapping) are based on the detailed specifications in the aggregate account of agriculture, prepared by the Budgeting Committee for Agriculture (BCA). Thus to a large extent the calculations are based on prices and quantity data from the BCA, given on a detailed level both of gross output and intermediate consumption.

The calculations on gross output of crops and horticultural products by the BCA are largely based on annual agricultural statistics (based on sample surveys) of Statistics Norway, and information received directly from sales organisations connected to agriculture. For the calculations of livestock production and intermediate consumption, the Budgeting Committee uses statistics from the farmers' own sales organisations.

Feed for own use appears in the national accounts as an estimated internal delivery between production of crops and livestock production, computed on the basis of the Budgeting Committee's calculations on supply of feed.

The calculations for forestry and hunting and game propagation are based on annual forestry and hunting statistics issued by Statistics Norway.

In general, the Norwegian agricultural accounts are compiled on a detailed level both as regards output and input. On the most detailed level the agricultural sector produces 68 goods, of which 18 are produced in forestry. Output is recorded at the moment the production process is completed, and input at the moment goods and services are consumed. Value added is a residual (balancing item), at producers' prices, following gross output valued at producers' prices.

The subsidies connected to the agricultural production are not always recorded directly to the agricultural sector. Transfers from government through the Agricultural Agreement are partly (about 40%) directly recorded as subsidies in the agricultural sector. Those which are not, are mostly recorded through manufacturing and wholesale and retail trade. In those cases the agricultural sector is benefited with a higher price on their products. This regards, among others, part of the subsidies on milk production, which are recorded through the dairy sector, and subsidies on crop production, which are recorded through wholesale and retail trade.

In Norway, the perpetual inventory method is used to determine consumption of fixed capital, i.e. consumption of fixed capital is computed indirectly based on long time-series for gross fixed capital formation expressed at constant prices. As part of the computations, estimates on average lifetime for capital goods are introduced for all types of investment. As a result consumption of fixed capital at constant prices is obtained. Figures at current prices are then calculated by means of relevant price indices.

The changes in livestock status are treated in accordance with the SNA recommendations, and livestock is divided into two categories. Increase in livestock is therefore distributed between changes in inventories and gross fixed capital formation.

As regards crop production, crops are recorded as output when harvested. In other words, crops still in the fields are not recorded as output in the form of work-in-progress.

In forestry, wood which has been cut down, but not transported out of the forests, is treated as output. Thus increase in stocks of timber and fuelwood is recorded as changes in stocks. The costs of silviculture are distributed between intermediate consumption and gross fixed capital formation, according to type of costs.

The value added tax system is treated on a net basis, by estimating values on accrued basis from VAT rate (20%) and commodity flows of the national accounts.

4.3. The method of compiling the regional agricultural accounts

In general, the distribution of the agricultural accounts figures by region is done on a detailed level of products as regards output. Some of the products are, however, broken down by region in two steps. First they are broken down by county (NUTS-2), and as a second step further down to NUTS-3 level. The reason for this two step calculation is that the sources available, do not provide suitable data for both regional levels for these products. The sources used for the NUTS-3 level contain indicators less reliable than the indicators used at the county level. Breaking down by county is done by means of relevant volume figures from annual statistics of agriculture and forestry (issued by Statistics Norway). These statistics are to a large extent based on annual sample surveys which are not suitable for breaking down to NUTS-3 level. The distribution by NUTS-3 regions is to a large extent based on The Census of Agriculture and Forestry for the year 1989. However, the indicators available are, in some areas, considered of poorer quality than the indicators in the annual sample surveys.

The output of each product is distributed by region using spesific indicators. Mostly these indicators are quantities of production. The distribution of crop production is done mainly by

information of crop quantities at the county level. At the NUTS-3 level we also use crop area for some products because crop quantities are not available. As regards livestock production both quantities and prices are used for milk, cattle, pig and sheep production. For milk production, milk delivered to dairy is considered the relevant quantity measure, while slaughtered quantity is used for cattle, pig and sheep production. For the rest of the animal production both slaughtered quantity and number of animals are used as indicators.

As a consequence of lack of information, most of the input is distributed proportionally to output. However, some important goods consumed as intermediate consumption in crop and livestock production are distributed by means of spesific indicators. This regards fertilizer, grain feed and feed for own consumption.

Subsidies/taxes and consumption of fixed capital are for some types distributed by means of spesific indicators, and for others in proportion to production. I.e. the part of subsidies on milk production recorded directly in agriculture, are distributed according to information from the dairies, while some subsidies on crop and meat production are distributed according to figures from the sales organisation.

5. ANNUAL WORK UNITS IN AGRICULTURE AND FORESTRY 1989

5.1. Total annual work units (AWU) in agriculture and forestry by NUTS-3 regions

The main statistical source is the Norwegian Census of agriculture and forestry 1989. As the census considers the two industries combined, the total number of AWU has been calculated in a first step. In a second step forestry and agriculture have been separated, using data from the Survey of agriculture 1990. This survey covers hours worked in the period 1.6.1989 to 31.5.1990. The results of this second step are less reliable than those of the first step.

The Census of agriculture and forestry reports the number of employed persons in each of 5 intervals of hours worked. In our estimates, each interval is assigned an average number of AWU per person (table 15). It is assumed that each person in the open-ended interval of more than 1500 h. represents one AWU. From the Survey of agriculture 1990, we find that persons in this category worked 2137 hours on average. The part of an AWU attributed to the other intervals in table y is then the mid-point number of hours divided by 2137.

Table 15. Estimated average AWU per person by interval of hours worked according to the Norwegian Census of agriculture and forestry 1989 and the Survey of agriculture 1990.

Interval of hours worked	AWU per person
0-99 h	0.02
100-499 h	0.14
500-999 h	0.35
1000-1499 h	0.58
1500 + h	1.00

The number and regional distribution of AWU in reindeer husbandry is reported from the Directorate for Reindeer Husbandry. This (small) part of agriculture was not covered by the Census of agriculture.

5.2. Dividing total AWU between agriculture and forestry

Initially, the proportion of total AWU attributed to agriculture at the national level was estimated by the number of hours worked according to national accounts statistics.

The total AWU by NUTS-3 regions (except AWU in reindeer husbandry) was split by industry using information from the Survey of agriculture 1990 and special information on the use of tree processors in forestry.

The Survey of agriculture 1990 did not include hours worked by self-employed persons owning and operating tree processors. According to information collected from the Agricultural University of Norway, Department of Forestry, approx. 300 such processors were operative in 1989. We have accordingly distributed 300 AWU by NUTS-3 regions, using quantity of timber cut by tree processors reported in the Census of agriculture and forestry 1989 as distribution key. To distribute the rest of the AWU's, we estimated the proportion of total hours worked that could be attributed to forestry at the NUTS-3 level according to the Survey of agriculture 1990.

Results of this survey are normally reported on the county (NUTS-2) level. The sample is, however, relatively large (approx. 11 per cent); thus estimation on NUTS-3 level was possible. The share of forestry in total AWU in each NUTS-3 region is first assumed equal to the estimated proportion of hours worked, and then finally adjusted proportionally to sum up to the national total. AWU in agriculture is then calculated residually. Many regions have little activity in forestry. The estimate of gross value added per AWU in forestry in these regions are particularly exposed to sampling and rounding errors. This should, however, be of minor importance to the resulting estimates of AWU in agriculture.

6. EMPLOYMENT

6.1. Definition

In the Norwegian National Accounts employed persons are defined as the annual average number of persons in productive activites within Norwegian territory. Part-time workers and persons temporarily absent from work are included. However, persons with long-time absence from work (unpaid leave) are excluded. Persons engaged by goverment measures to promote employment are included as employed persons if they receive wages. Persons liable for military service and seamen abroad are also included.

The total industry employment comprise oil activities (pipeline transport not included), manufacturing, mining and quarrying, electricity supply, construction and oil drilling.

The agricultural employment comprise agriculture, forestry, fishing and breeding of fish.

6.2. Total employment 1986-1991

The National Accounts (NA) figures for total employment 1986 -1991 at the place of work are broken down to NUTS-3 regions by administrative employment data (1986- 1991). The quality of the administrative employment data is not good enough for official statistics. Thus the data are corrected before being published. The administrative data used in the breakdown procedure have not been corrected. The quality problem is connected to a very small number of regions each year. The impact on the regional distribution is expected to be small.

We have established a NUTS-3 code 999, which include persons with place of work at the Norwegian continental shelf, Svalbard and persons with unspecified place of work.

6.3. Industry employment 1980 -1991

The NA figures for total industry employment 1980 - 1991, at the place of work are divided into 3 groups and distributed to NUTS-3 regions by three different keys. These 3 groups of estimated regional NA figures are then aggregated to figures for the total industry employment.

A. The NA figures for manufacturing, mining and quarrying are broken down to NUTS-3 regions by a set of regionals figures from the Manufacturing statistics 1980 - 1991, Statistics Norway.

B The NA figures for construction are broken down to NUTS-3 regions by figures from the Construction statistics 1980 - 1990, Statistics Norway. Figures for 1991 are broken down by keys for 1990.

C The NA figures for electricity supply are broken down to NUTS-3 regions by data on employees by industry division 1986 -1991. Figures for 1980 - 1986 are broken down to NUTS 3 by data for 1986.

6.4. Agricultural employment 1989.

The NA figures for total agricultural employment 1989, at the place of work are broken down to NUTS 3 regions by administrative employment data by major industry group. The quality of the administrative employment data by major industry group is not good enough for official statistics. Thus

the data are corrected before being published. The administrative data used in the breakdown procedure have not been corrected. The quality problem is connected to a very small number of regions each year. The impact on the regional distribution is expected to be small.
