# **Preface**

Activity plan 2012. Risk assessments presents overarching risk assessments associated with the Activity plan and main initiatives in 2012, as well as some examples of key statistics and projects. Priorities and initiatives for the work in 2012 have been compiled in the publication Activity plan 2012 Statistics Norway. A publication dedicated to internal budget allocation is also in preparation.

Activity plans for each of Statistics Norway's departments are also available, along with risk assessments for individual areas.

Statistics Norway Oslo/Kongsvinger, 12 March 2012

Frøydis Langmark Chair of the Board

> Hans Henrik Scheel Director General

# **Risk assessment for Statistics Norway 2012**

Statistics Norway's primary aim is to meet society's need for official statistics and compile key analyses based on these statistics.

Achieving this aim is dependent on a number of factors, such as effective statistics production, quality, and society's confidence in Statistics Norway being objective, and not misusing data. These conditions are summarised in the European guidelines on statistics. Consideration to quality in all areas is also highlighted in Statistics Norway's central strategy documents and plans.

The following key factors are important to Statistics Norway's activity:

- Effective and quality assured statistics production and research
- Effective dissemination solutions
- Effective ICT systems
- Effective financial management
- Effective purchasing routines
- Effective personnel management
- Effective security routines

Statistics production and research are core activities in Statistics Norway, but the other factors are also crucial to our success. Some of these will therefore be included as critical success factors in the risk assessment of core activity. However, these still need to be assessed separately in order to facilitate a more detailed follow up where required. Effective and relevant expertise is vital to our success in all areas, and will therefore also be included in most of Statistics Norway's risk assessments.

Risk assessments have been undertaken of the statistics production, IT, financial management, purchasing and security. A more detailed risk assessment has also been carried out in connection with the development of the projects New ssb.no, Population and housing census 2011, Joint data receipt and the IT solutions for parts of the financial statistics that were transferred from Norges Bank to Statistics Norway. The risk assessment for EDAG is not included in this overview since no developments will take place in 2012 - only some planning before the activity is expected to be taken up again in 2013.

The risk assessments are performed with an implementation date of 1 January 2012 and onwards.

Overview of risks associated with the areas that are considered in the report:

#### 1 Statistics production

Risk of inadequate capacity with regard to the necessary expertise and risk of breakdown in IT systems based on software for which Statistics Norway only has limited expertise.

2 *IT* 

Risk of inadequate expertise, of undocumented old systems requiring a disproportionate share of resources, of unauthorised access to solutions, interruptions and downtime in excess of defined limits.

3 Financial management and purchasing

Risk of incorrect and poor solutions in Statistics Norway due to inadequate capacity in the Norwegian Government Agency for Financial Management (DFØ).

4 Security

Risk of inadequate information security and data security, and lack of security expertise.

#### 5 Key projects and examples of statistics

### 5.1 New ssb.no

Risk associated with establishing a new technical infrastructure, low performance in the developed solution and insufficient integration of StatBank in the new ssb.no.

#### 5.1 Population and housing census 2011

Risk that we do not achieve consistent household and dwelling data of sufficient quality.

#### 5.3 Joint data receipt

Risk that the adaptations in ISEE will not be finished in time, risk of inadequate access to resources, of inadequate coordination in support projects, not enough time for testing, insufficient integration with Altinn and that the project does not achieve the development objectives in time.

#### 5.4 Securities statistics

Risk of stoppage of old systems and inadequate data input.

#### 5.5. Data input system for banks and finance enterprises

Risk associated with the system using software in which Statistics Norway does not have expertise, risk that the system cannot handle changes in Statistics Norway's IT infrastructure and of problems in the systems in the event of changes in reporting.

#### 5.6 International financial statistics

Risk associated with the system using software in which Statistics Norway has inadequate IT and specialist expertise, and of insufficient quality of the international population.

The main features of the risk assessments are summarised in a template, in addition to risk mapping according to the Government Agency for Financial Management's system. The template contains a column with a description and explanation of risk, a column for the ranking given in the risk mapping and a column for comments on initiatives and follow-up of any previous initiatives. With regard to critical risks, a detailed account is given of which specific consequences may be relevant.

The risk associated with various statistics/projects can be regarded as critical or high without necessarily entailing a corresponding degree of seriousness at Statistics Norway level, for the statistics production overall or for the users. The assessments for the projects are carried out by the project owners, who can use various criteria. Efforts will be made to harmonise these assessments going forward.

Initiatives relating to key development projects such as the new ssb.no and joint data receipt are governed by timetables for the projects. The milestone plan and responsible persons are stipulated in the project plans and are managed through the portfolio management.

Most of the initiatives apart from the projects are permanent. The departmental directors are responsible for the initiatives in the individual subject areas. For statistics production as a whole, this applies to all departmental directors in statistics-related areas, while the IT director is responsible for IT-related initiatives in all departments.

### Different types of risk

As mentioned in the preface, this report presents risk assessments associated with the Activity plan and main initiatives in 2012, as well as some examples of key statistics and projects. The risk is related to events that can have a negative impact on achieving objectives.

Statistics Norway has chosen the term "overarching" for risk at institution level. These risks mainly entail *strategic risks* that can have an impact on achieving objectives in the long term, but in some cases *operational risks* can also quickly lead to failures in Statistics Norway's ongoing production or service deliveries. The element of operational risk increases with the level of detail, such as when the level reaches the production of an individual statistical area. Some considerations of various risk types in Statistics Norway are given below.

#### **Operational risk**

Operational risk is defined as events and conditions that can lead to a failure in the activity's ongoing production or service delivery, risk of loss as a result of insufficient or failing internal processes or systems, human error, or external events.

Examples of operational risks in Statistics Norway can be linked to:

- The dissemination; ssb.no going down
- The data collection; IDUN/Altinn going down
- > The production of individual statistics, through manual errors or system errors
- Errors in accounts or budgets
- Unsuitable appointment of employees
- ➤ Incorrect decisions when imposing fines
- Deviations from the security provisions, such as breaches of confidentiality
- Fraud or misconduct

Examples of risks included in the current risk assessments that relate to operational risks (directly or indirectly) are the risk of the breakdown of IT systems, expertise shortcomings (unsuitable appointments), poor project management and underestimating projects, errors in the accounts, security breaches, risk of fire, break-ins and irregularities. Errors in the statistics can affect the quality and reputation of Statistics Norway in the long term.

The internal control has reviewed the processes linked to the production of a number of individual statistics, in other contexts known as quality reviews. A number of initiative proposals have been put forward, which are being followed up by the relevant divisions. Various corresponding reviews are planned for 2012. Efforts to standardise the statistics are also underway, with several statistics being produced using a common tool.

Errors in the statistics are logged, but work is ongoing to distinguish serious errors from minor errors that do not affect the result to any notable degree. It is also important to distinguish between errors and revisions of statistics that lead to figures being changed retrospectively. Figures that are published as preliminary figures and which are subsequently revised due to the supply of new data and more information are not classed as errors. The statistics will always be associated with a degree of uncertainty, and it is important to describe the uncertainty.

Errors are sometimes linked to input data, which Statistics Norway spends a great deal of time examining. There is no goal to prevent all errors; as already discussed, statistics are inherently uncertain, and the use of resources on revisions audits must be balanced with accuracy, in the same way as for timeliness. However, in order to improve the quality of input data, Statistics Norway has initiated measures with important register owners.

As from 2012, efforts will be made to develop an indicator for errors in the statistics. This indicator can be reported in the annual report, which until now has only contained a written reference to serious errors.

The upgrading of a manual for dealing with fines is in its final stages. The updated manual is expected to improve the quality of managing individual decisions on fines.

Statistics Norway's security provisions are described in a separate *Security manual for Statistics Norway*. The manual describes a procedure for how deviations from the security provisions are to be dealt with. Statistics Norway employees are urged to report deviations on the relevant form to Statistics Norway's security adviser. The security manual will be updated in 2012. The deviation reports are registered and discussed in Statistics Norway's Security committee.

#### Inherent risk and current risk

*Inherent risk* is the underlying risk that an activity has before implementation of measures and controls aimed at reducing the risk.

*Current risk* is the risk level after controls and measures that have already been implemented.

Expected future risk is the risk level in the event that further measures are to be implemented.

Statistics Norway has elected to apply the *current risk* to its risk assessments. Implemented measures and planned measures are described, but no explanation is generally given of the *inherent risk* there may have been without the measures that have been implemented and what the *expected future risk* could be after implementing new, proposed measures.

# 1. Statistics production

**Goal:** To maintain the ongoing production and dissemination of statistics with a level of quality that is at least equal to the current level.

**Change:** There is no change in relation to the last risk assessment.

	Risk	Level	Initiative/follow-up
1	Expertise	High	a. Follow-up of
	➤ Risk of lack of capacity with		competence strategy,
	regard to necessary expertise		with recruitment
			initiative at universities
	Particularly applies to expertise		and university colleges,
	linked to IT systems, such as JAVA		and training of new
	expertise related to development and		employees

			Data Inspectorate
			b. Initiatives to reduce the
			response burden

# Risk map for statistics production

Consequence

# 2. IT

Risk assessment of Statistics Norway's general ability to deliver with regard to projects and administration work.

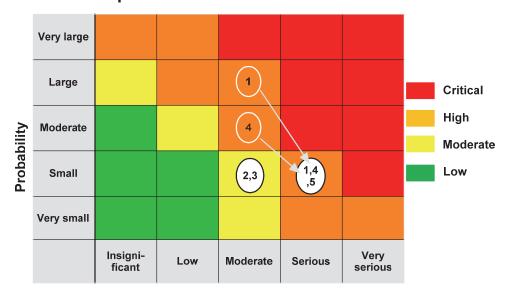

Goal: Satisfactory IT infrastructure in Statistics Norway.

**Change:** Only minor changes have been made within the same degree of risk, but various measures have been implemented that are expected to gradually reduce the risks.

	D: 1	T 1	т.	·· ··
	Risk	Level	Ini	tiative
1	Skills gap	High	a.	Carry out training
	Risk of gap in skills between			initiatives. Extensive
	what is needed to master			JAVA training in 2012
	"old" systems and what is		b.	Outsource external
	needed to master the new			assistance
	systems			
	Risk of recruitment freeze			
2	Unclear project orders	Moderate	a.	Strengthen planning skills
	➤ Risk of the IT work in		b.	More precise requirements
	development projects being			for planning
	underestimated		c.	Increase the precision in
	<ul><li>Risk that the orders for IT</li></ul>			the orders

			u.	Statistics Norway's legal
				expertise
			e.	Ensure that all information
			Ο.	on agreements and
				purchasing is available
				purchasing is available

Risk map - Financial management and purchasing

Consequence

# 4. Security

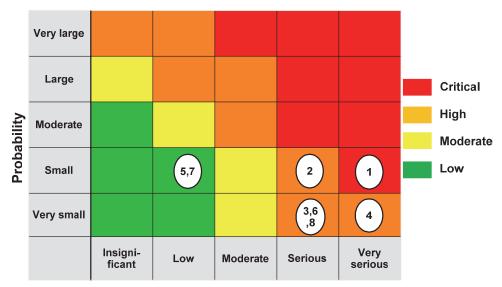

Goal: Satisfactory security in Statistics Norway

**Change:** Risk of terror and terror-related events has been included.

Information security	1	KISK		
Risk of inadequate information security  This applies to the inadvertent distribution of sensitive information (including to the media), disloyal employees, corruption (changing data for profit) and theft of equipment containing sensitive information (PCs, memory sticks, telephones etc.).  Potential consequences:  Distribution of sensitive information can reduce the public's confidence in Statistics Norway. This in turn can make it difficult to collect information in voluntary surveys etc. It can also be harmful to the units referred to in the information and can increase the likelihood of fictitious figures being reported.  2 Data security  This applies to serious viruses, hacking, changes to data in external web services, loss of internal IT  Processing sensitive information, cf. introduction of KOPP (client upgrading) b. Consider alternatives to storing personal sensitive data with personal ID numbers c. Ongoing control that the need-to-know principle is being adhered to for access permissions  Timetable: KOPP is included in the portfolio/AP2012. Planning is ongoing and implementation will start in 2012.  High  a. Introduction of KOPP (client upgrading) b. Use of DME for secure synchronisation and storage of mobile units c. Use of encrypted memory sticks for sensitive information	1

# 5. Important projects and examples of statistics

#### 5.1. New ssb.no

**Goal:** Develop ssb.no with a new user interface, revised and user-friendly structure, new services for wide distribution and new publishing solutions.

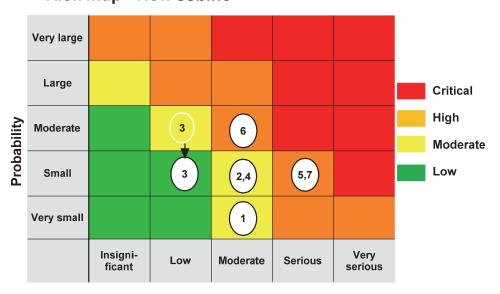

**Change:** The risk associated with changing existing web routines is no longer relevant and the risks associated with user needs and functionality have been reduced.

The assessment below is based on the launch date 29 April 2012. All specified risks have defined initiatives and plans aimed at achievement by the launch date.

	Risk	Level	Initiatives/follow-up
1	Management and coordination	Moderate	_
1	<ul><li>Risk of inadequate project</li></ul>	Moderate	a. Frequent meetings and close follow-up in
			•
	management and coordination		project; steering group,
	Duningt grown and marinet		project, scrum team, infrastructure and
	Project owner and project		
	manager's ability to make decisions		StatBank group (weekly
	that ensure holistic solutions and		meetings)
	processes. Many persons involved		b. Portfolio management
	means a large need for coordination.		responsible for
	The project includes external		prioritising in relation to
	consultants. There is also a need for		other projects
	ongoing assistance from critical		c. Important decisions in
	resources in infrastructure.	3.6 1 4	steering group/DM
2	Resources	Moderate	a. Ongoing follow-up of

	last conversion to launch is		cannot be converted
	demanding (double publishing)		d. Redevelop obsolete
	<ul><li>Risk that some old content is no</li></ul>		products
	longer available		e. Ongoing prioritisation of
	1011501 414114010		t. ongoing prioritisation of

	Risk	Level	Initiatives/follow-up
5	Technical infrastructure  ➤ Risk of delayed delivery of production environment	High	remaining content tasks  f. Scouring the current web to find all relevant products  a. Prioritise internal resources  b. Staff with external
	<ul> <li>Risk of low performance in the environments</li> <li>Risk of insufficient time for necessary technical testing and tuning</li> </ul>		resources c. Dedicated servers and middleware d. Establish plan for delivery of environment e. Continuous testing and tuning of environments
6	Non-functional requirements  ➤ Risk of low performance in developed solution  ➤ Risk that publication at 10am sharp cannot be met	High	<ul> <li>a. Continuous testing and tuning of environments</li> <li>b. Refactoring of solutions developed in-house</li> <li>c. Cooperation with CMS (Content Management System) supplier</li> <li>d. Clarify acceptance requirements and alternative solutions with regard to punctual publishing</li> </ul>
7	<ul> <li>StatBank</li> <li>➤ Risk associated with completion of security improvement of StatBank Web</li> <li>➤ Risk associated with completion of menu structure/short names with new ssb.no</li> </ul>	High	<ul> <li>a. Prioritise internal resources</li> <li>b. Devise a delivery plan for completion of the StatBank tasks</li> </ul>

# Risk map - New ssb.no

Consequence

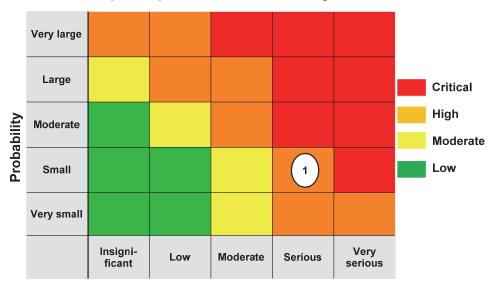

### 5.2. Population and housing census 2011

**Goal:** To assemble and present data for the Population and housing census 2011 that meets national and international requirements. The census is based solely on register data.

**Change:** Initiatives relating to quality in administrative registers have been implemented. The project must use register data with its existing quality. There is therefore no longer a risk associated with input data.

	Risk	Level	Initiatives/follow-up
1	Household and housing data  ➤ Risk of not achieving consistent household and housing data of sufficiently good quality  Linking data from the National Population Register (DSF) and the land register (Matrikkelen) does not instantly provide data for households and dwellings of sufficiently good quality. Further processing of data is needed in Statistics Norway in order to achieve this.	High	Develop a method that     ensures consistent data for     households and occupied     dwellings

# Risk map - Population and housing census 201

Consequence

# 5.3. Joint data receipt

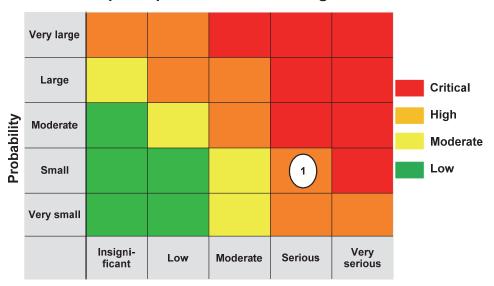

**Goal:** To develop joint data receipt for Statistics Norway where data is received, processed and published in a uniform and effective way using metadata.

**Change:** The risk has not increased in general, but several potential risks have emerged as the project has gained more experience.

			7
	Risk	Level	Initiatives/follow-up
1	Adaptations in ISEE  Risk of ISEE not being finished with adaptations for receipt of metadata, whereby surveys using ISEE cannot then be transferred to joint data receipt	High	<ul> <li>a. Draw up transparent plans for joint data receipt and ISEE</li> <li>b. S730 and S830 follow up the activities closely</li> </ul>
2	Resource access  ➤ Risk of lack of access to key skills such as project manager	High	a. Continuous follow- up of resource access and needs
3	Coordination  ➤ Risk of invidious consequences in supporting systems/projects (e.g. ISEE, Altinn), which in turn affect the progress in joint data receipt	High	<ul> <li>a. Appoint someone to have coordination responsibility for the data collection projects</li> <li>b. Director of division S830 takes a coordination responsibility for the line tasks, particularly in relation to the Altinn conversion from IDUN</li> </ul>
4	Not enough time for testing  Risk of the testing periods being too short if serious errors are identified during the testing. Fault correction may therefore lead to delays in relation to the original project plan.	High	<ul> <li>a. Define effective unit tests that are used during both the development and test period</li> <li>b. If necessary, modify the project plan</li> </ul>
5	Relationship between administration	High	a. Focussed and
	<ul> <li>and development</li> <li>Risk of resource use for administration tasks affecting the progress of the development of the system</li> </ul>		prioritised administration
6	<ul><li>Integration with Altinn</li><li>➤ Risk of integration and interface for pre-completion not being in place on time</li></ul>	High	<ul><li>a. Close follow-up with Altinn</li><li>b. Close follow-up with SERES</li></ul>
7	PreSys – framework solution for pre- print and pre-completion of information  ➤ Risk of the project not achieving the development goals on time	High	a. Ensures that plans for joint data receipt and PreSys are transparent
8	Interface for notices in Altinn  ➤ Risk of the interface for notices in Altinn not being in place on time	Moderate	a. Close follow-up with Altinn

	Risk	Level Initiatives/follow-up	
9	Too governed by the pilots	Low	a. Ensure that plans for
	<ul><li>Risk of pilots governing joint data</li></ul>		the development
	receipt and the solution therefore		projects joint data
	being adapted to the pilots and not		receipt and PreSys
	taking the form of a general		are transparent
	framework solution		b. Choose pilots that
			also support and use
			framework solutions

# Risk map - Population and housing census 201

Consequence

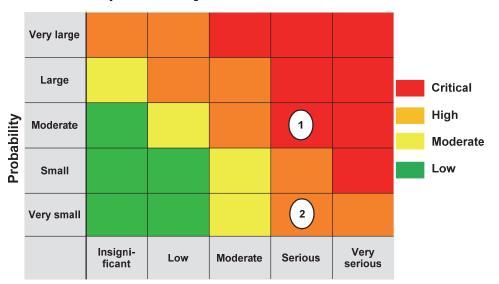

#### 5.4. Securities statistics

**Goal:** To establish a system solution that reduces the risk and forms the basis for uniform securities statistics, which adheres to central international statistical standards and is a good source for the national accounts/balance of payments.

**Change:** There is currently no change from 2011. However, in relation to the risk profile from 2011, a new technical solution for unit trust and depository statistics will soon be ready for setting into production. This solution will replace the last of the old, risk-exposed production systems. The goal of a common system solution for all of the securities statistics has not yet been achieved.

	Risk	Level	Initiatives
1	IT systems ➤ Risk of insufficient maintenance of IT systems	Critical	a. Solution to replace the current solution for unit trust and depository statistics to be set into production in
	Possible consequences Lack of maintenance and improvement or postponement of introduction of new systems can lead to a stoppage for several of the securities statistics, with the worst case scenario being that data is not delivered on time.		b. Sufficient expertise in the old systems to be safeguarded internally and/or externally
	The current solution was transferred from Norges Bank and uses software that Statistics Norway does not support or have much expertise in.		Initiative a was actuated in 2011 and completion is expected in 2012. Initiative b is to be followed up in cooperation with department 700 until initiative a is completed.
2	Reporting ➤ Risk of deficiencies in the supply of third party information	High	a. Close cooperation with the individual respondent on format and delivery
	The securities statistics are largely based on third party information. Incomplete delivery of such data from some major respondents could therefore have serious consequences for the statistics. The alternative, i.e. direct reporting, is not possible in practice due to the scope and the resources this would require. The likelihood of problems arising with these deliveries is, however, very small.		The initiative is permanent.

# Risk map - Security statistics

Consequence

### 5.5. Input data system for banks and financial institutions

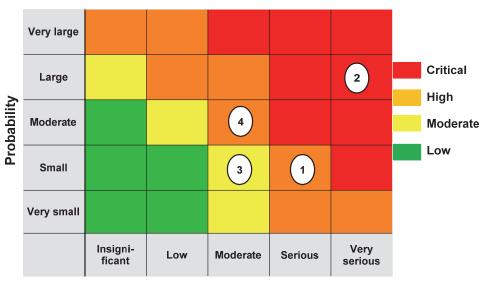

**Goal:** To receive data of good quality from banks and financial institutions for use in publishing etc. in Statistics Norway, and for the ongoing supervision of the financial institutions by the Financial Supervisory Authority of Norway.

**Change:** No changes in relation to the risk since the last assessment for 2011. However, a new technical system planned for implementation in 2012 will reduce/remove the risk in relation to the existing system.

	Risk	Level	Initiatives
1	Technical changes  Risk of inadequate maintenance	High	a. Long-term solution is the development of a new system
	The system uses software that Statistics Norway does not support or have expertise in, and the maintenance is dependent on an external consultant.		b. Initiative to maintain and gain an overview of any new technical needs in the current system, until a new system is in operation
2	Changes in infrastructure  Risk of the system being unable to support changes in Statistics Norway's IT infrastructure  The system is vulnerable to changes in infrastructure outside the system, e.g. when replacing the e-mail server and operating system. The system has been out of operation during certain periods.	Critical	a. Ensure that sufficient information is given on changes in Statistics Norway's infrastructure
	Possible consequences: Banks and financial institutions are unable to report data to Statistics Norway. The Financial Supervisory Authority of Norway and Norges Bank do not receive the necessary data for monitoring and supervising the financial markets. Statistics Norway does not receive data for the money supply (M2), credit indicator (K2), national accounts and balance of payments. Furthermore, Statistics Norway may not be able to fulfil international obligations from the IMF (SDDS).		
3	Client program ➤ Risk of problems when using the client program  The input data solution is based on a client program that	Moderate	<ul><li>a. Document and convey changes to the respondents</li><li>b. Phase out client program in a new technical solution</li></ul>

	Risk	Level	Initiatives
	is downloaded by the respondents, and is vulnerable to changes since changes require the user to have a certain degree of technical expertise.		
4	Reporting  Risk of problems with the systems after changes to the reporting  Frequent changes and new requirements for reporting from banks and financial institutions require a flexible and robust system	High	a. The new system that is developed must be robust in relation to changes in the structure

Risk map - Input data system for banks and financia institutions

Consequence

### 5.6. International financial statistics

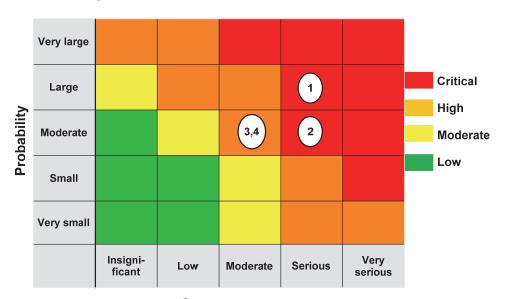

**Goal:** To meet international obligations and prepare and publish consistent international statistics with a high level of quality and timeliness. The relevant statistics are the balance of payments' financial accounts, international investment position, direct investments in/from abroad, portfolio investment abroad and external debt.

**Change:** A number of improvements have been made since 2011 with a view to documentation and sharing knowledge, but the risk profile on both the IT and statistical side as a whole has not changed.

	Risk	Level	Initiatives
1	IT systems ➤ Risk of errors that stop the production or lead to inconsistencies in the statistics  Possible consequences Delays in the production and possibility of the statistics not being published or delivered to	Critical	<ul> <li>a. Mapping and documentation of sources, data flow, methods and calculations</li> <li>b. Coordination and development of the IT systems. Cf. project description for "Integrert finansstatistikk overfor utlandet - IT-omlegging" (Integrated international</li> </ul>
	international organisations on time. Reduced quality of the statistics that are published and reported.		financial statistics – IT adaptation)  Work was carried out on initiative a in 2011.  Work on initiative b has not yet started.
2	IT expertise/resources  ➤ Risk that the expertise in the IT systems is only in S940 and that only one person has the necessary expertise  Possible consequences  Vulnerability in expertise and shortage of resources can lead to delays in the production and publishing, as well as deliveries to international organisations.  This risk factor reinforces point 1.	Critical	<ul> <li>a. Skills transfer from S940 to S740, i.e. involve a larger IT environment</li> <li>b. Available IT operating resources</li> <li>c. Available IT project resources</li> <li>Work on the initiatives in points a and b has started, but the expertise is still centred around S940.</li> </ul>
3	Specialist expertise/resources ➤ Risk of some skills disappearing among senior employees	High	<ul> <li>a. Continue implementation of the group's skills plan</li> <li>b. Document routines</li> <li>The initiatives are ongoing, but developing a broad skills base takes time.</li> </ul>
4	Population and sample  ➤ Risk of inadequate quality of the foreign population	High	<ul> <li>a. Allocate sufficient resources in S940 and any other relevant divisions</li> <li>b. Establish the foreign population in the Central Register of Establishments and Enterprises (cf. project), including devising</li> </ul>

Risk	Level	Initiatives
		cooperation routines between the parties involved c. Establish a shareholder database
		Initiatives a and b are ongoing. Initiative c is being implemented in ISEE.
